Orientation, history taking, and examination

Essam Osman
Associate Professor
College Of Medicine
King Saud University
Orientation
Course OPH 432
Why should you be interested in the eye?

Internet is a window to the world
Objectives

a. To know the basic ophthalmic anatomy and physiology.

b. To recognize assessment and management of common ophthalmic diseases.
Objectives

c. To know how to handle common ophthalmic emergencies.
d. To handle simple ophthalmic diagnostic instruments.
e. To be aware of common ophthalmic operations.
Components of the course

- Lectures
- Clinics
- Clinical sessions
- ER
Lectures

1. History taking and physical examination in ophthalmology
2. Basic Anatomy and Physiology of the Eye
3. Lid, Lacrimal, and Orbit Disorders
4. Ocular emergencies and red eye
5. Strabismus, Amblyopia and Leukocoria
6. Acute Visual Loss
Lectures

7. Chronic Visual Loss
8. Refractive Errors
9. Ocular manifestations of systemic diseases
10. Neuro-ophthalmology
11. Ocular Pharmacology and Toxicology
Clinic
Clinical skill sessions

- External Ocular Examination, Ocular motality and Alignment
- Visual acuity and Ophthalmoscopy
- Visual field, Tonometry, Pupil Examination
Marks distribution

- 30 marks for the MCQs
- 40 short answer question
- 20 marks for the OSCE
- 10 marks for attendance in clinical sessions, clinics, ER
Recommended textbooks

1. Required Text(s)
   
a. Lecture notes Ophthalmology (latest edition)
      By: Bruce James (published by Blackwell Science)
   
b. Basic Ophthalmology (latest edition)
      By: Cynthia A. Bradford (latest edition)
      (published by American Academy of Ophthalmology)
   
2. References

- Vaughan and Asbury’s general Ophthalmology
  By: Paul Riordan-Eva (published by Lange)

- Clinical Ophthalmology: A Systematic Approach
  By: Jack T. Kanski (published by Butterworth Heinemann)
c. Electronic Materials, Web Sites

1. Department internet website.
2. Department’s teaching staff personal websites on University site.
3. University and KKH/KHUH Library.
4. Audiovisual Unit of the Ophthalmology Department.
5. PubMed
5. Medscape
6. The digital journal of ophthalmology (www.djo.harvard.edu)
EYE
The Visual Pathway

- Cornea
- Anterior Chamber
- Iris
- Lens
- Vitreous
- Retina
The Visual Pathway

* Phototransduction: By photoreceptors (rods and cones)
* Image processing: By horizontal, bipolar, amacrine and RGCs
* Output to optic nerve: Via RGCs and nerve fiber layer
Diagnostically and functionally, it is the most important square inch of the body surface.
• The eye is so intimately connected with the rest of the body that it reveals enormous amount of general information.

• Eye is the only part of the body where blood vessels and central nervous system tissues can be viewed directly.
Examples
Neurological connections
The 12 cranial nerves provide us with a large part of our information about the brain. Of these, the eye examination evaluates CN II, III, IV, V, VI, VII, VIII.

In addition, it provides information about the autonomic pathways. (sympathetic /parasympathetic)
The best known connection between the brain and the eye is the ON.

The visual pathways, which extends from front to back across the brain can be studied easily and safely using perimetry. It can differentiates accurately between lesions of the temporal, parietal, and occipital lobes.
In addition, the ON has important clinical relationships to the pituitary gland, the middle ventricles, the venous sinuses, the meningeal and bony structures of base of the skull.
ON has the diagnostically useful capability of swelling with ↑ ICP (papilledema).

Or

visibly pale (optic atrophy) when its nerve fibers damaged at any point from Retina → LGB.
The study of CN III, IV, V, VI can evaluates the brain stem, cavernous sinus, apex of orbit.
Unilateral dilated pupil after head injury can occur due to pressure on pupil constrictor fibers of CN III.

CN VI involved in mastoid infection (petrous ridge)

Parotid gland, Inner ear disease → CN VII.

Nystagmus → CN VIII
Focal brain lesions like:

- Vascular occlusions
- Hemorrhage
- Neoplasm

Diffuse brain lesions like:

- Infections
- Demyelinating disorders → nerve damage.
Vascular connections
Venous flow disorder: cavernous sinus thrombosis, carotid – cavernous fistula (orbital congestion)
Arterial emboli can reach the retina from carotid artery, heart valves, subacute endocarditis.

Specific disease of the vessels like:
- PAN
- temporal arteritis
- HTN.
Hematological disorders of all types can manifest in the fundus.

Almost all metabolic disorders can affect the eye:

- **DM**: DR, cataract, RE, ophthalmoplegia.
- **Hypoparathyroidism**: cataract
- **Wilson’s disease**:
Thyroid eye disease: Exophthalmos, Lid retraction.

Infections: (Syphilis, Toxoplasmosis, Rubella)
Mucocutaneous disorders: SJS, pemphigus

Elastic tissue: (Pseudoxanthoma elasticum)

Allergy: VKC
Chromosomal abnormalities:

Trisomy: 13, 15, 21.

The eye is a delicate indicator of poisoning:
- Morphine addict $\rightarrow$ meiotic pupil
- Lead poisoning, vitamin A intoxication $\rightarrow$ papilledema
• I could go on and on about the discoveries possible in our most important square inch. "EYE"

@ 90% of our information reaches our brain via sight.

@ Unfortunately, of all the parts of the body, the eye is the most vulnerable to minor injury.
What are the objectives of the comprehensive ophthalmic evaluation?
— Obtain an ocular and systemic history.

— Determine the optical and health status of the eye and visual system.

— Identify risk factors for ocular and systemic disease.

— Detect and diagnose ocular diseases.
Establish and document the presence or absence of ocular symptoms and signs of systemic disease.

Discuss the nature of the findings and the implications with the patient.

Initiate an appropriate response. e.g. further diagnostic tests, treatment, or referral.
It is a gathering information process from the patient guided by an educated and active mind.

It is a selective guided and progressive elicitation and recognition of significant information.

History by skilled person can arrive at the proper diagnosis in 90% of patients.
It gives vital guidance for:

(a) physical examination
(b) laboratory work
(c) Therapy

- Failure to take history can lead to missing vision or life threatening conditions.
Chief complaint: “The patient’s own words”

“She cannot see with the RE”

You should not come to conclusion that her problem is nearsightedness and write down “Myopia of RE”.

- The patient needs will not be satisfied until he/she has received an acceptable explanation of the meaning of the chief complaint and its proper management.
History of the Present Illness:

- Detailed description of the chief complaint to understand the symptoms and course of the disorder.

- Listen and question and then write down in orderly sequence that make sense to you.
* The time sequence
  when, How fast, what order did events occur?
* Frequency, intermittency
* Location, Laterality
* Severity
* Associated symptoms
* Documentation (old records, photo)

  e.g ptosis, proptosis, VII N palsy.

  ➢ gradual painless decrease vision both eyes for 1y.
  ➢ Sudden painless decrease vision RE for 10 min.
“cannot see with RE”!!

- ? Only distance vision blurred.
- ? Blind spot is present in the center of VF
- ? Right side of VF of the RE lost
- ? Right VF of both eyes lost
- ? A diffuse haze obscures the entire field of RE

- Each of these has different diagnostic implication
- Most pt. has difficulty providing precise and concise description
Disturbances of vision:

- Blurred or decreased central vision
- Decreased peripheral vision. (glaucoma)
- Altered image size. (micropsia, macropsia, metamorphopsia).
- Diplopia (monocular, binocular)
- Floaters
- Photopsia (flash of light)
• Color vision abnormalities.
• Dark adaptation problems.
• Blindness
  (ocular, cortical).
• Oscillopsia
  (shaking of images).
Ocular pain or discomfort:

- Foreign body sensation
- Ciliary pain (aching, severe pain in or around the eye, often radiating to the ipsilateral forehead, molar area)
- Photophobia
- Headache
- Burning
- Dryness
- Itching: patient rub the eye vigorously (allergy)
- Asthenopia (eye strain)
Abnormal ocular secretions:

- Lacrimation, epiphora
- Dryness
- Discharge
  - (purulent, mucopurulent, mucoid, watery)
- **Redness, opacities, masses**
- **Anisocoria**
Family history:

Many eye conditions are inherited
- RE, glaucoma, strabismus, retinoblastoma, neoplastic, vascular disorders

- Familial systemic disease can be helpful in ophthalmic evaluation and diagnosis
  - Atopy, thyroid diseases, DM, certain malignancies.
• Ask about any eye problem in the family background?

• Ask specifically about corneal diseases, glaucoma, cataract, retinal diseases or other heritable ocular conditions.
Ask questions designed to confirm or exclude your tentative diagnosis

- significant positive
- significant negative

“Significant is equal to expected”

predict the physical and lab. finding likely to be present.

any discrepancy between the history and physical examination requires explanation
Ophthalmic examination
The Purpose is to evaluate:

1. Function
   - visual
   - non visual

2. Anatomy
   - the adnexa (lid and periocular tissues)
   - the globe
   - the orbit

eye movement
alignment
Ophthalmic examination

- Visual acuity
- External examination
- Motility and alignment
- Pupil examination
- Slit lamp biomicroscopy
- Tonometry
- Ophthalmoscopy
- Gonioscopy
- Retinoscopes
Vision:

- Vital sign (MUST)
- Good vision: intact neurological visual pathology, structurally healthy eye, Proper focus
- Subjective
How to test the vision?

- display of different -sized targets shown at a standard distance from the eye.
- Snellen chart.
- 20/20, 6/6
- Uncorrected, corrected
Testing poor vision:

- If the patient is unable to read the largest letter < (20/200)
- Move the patient closer e.g. 5/200
- If patient cannot read:
  - count fingers (CF)
  - hand motion (HM)
  - Light perception (LP)
  - No light perception (NLP)
External examination:

- Evaluate by gross inspection and palpation.

- Ocular adnexa. (lid, periocular area)

- Skin lesions, growths, inflammatory lesions.
• **Ptosis**

• **Proptosis, exophthalmos, enophthalmos**
• Palpation of bony rim, periocular soft tissue.

• General facial examination e.g. enlarged preauricular lymph node, temporal artery prominence.
Ocular motility:

Evaluate
- Alignment
- Movements
• **Misalignment of the eyes**
Movement:

- Follow a target with both eyes in each of the four cardinal directions of gaze.

- **Note**
  - speed
  - smoothness
  - range
  - symmetry
  - unsteadiness of fixation
  
  e.g. nystagmus
Pupils:

Examine for size, shape, reactivity to both light and accommodation.

- Direct response and consensual response.
- Afferent pupillary defect (Marcus Gunn pupil)
- Efferent pupillary defect.
• Pupillary abnormalities:
  - neurologic disease
  - previous inflammation – adhesion
  - acute intraocular inflammation - spasm
    - atony
  - prior surgical trauma
  - effect of systemic or eye medication
  - benign variation of normal
Slit lamp examination:

Is a table-mounted binocular microscope with special illumination source.

A linear slit beam of light is projected onto the globe – optic cross section of the eye.
• Slit lamp alone, the anterior half of the global (anterior segment) can be visualized.
Tonometry:

- The globe is a closed compartment with constant circulation of aqueous humor.
- This maintains the shape, and relatively uniform pressure within the globe.
- Normal pressure 10 – 21 mmHg.
Types of tonometry:

Schiotz tonometer
Goldman tonometer
• Glodmann applanation tonometer
Tonopen tonometer
Perkin tonometer
Air-puff tonometer
Ophthalmoscopy:

- **Direct ophthalmoscopy:**
  - handheld instrument.
  - standard part of the general medical examination.
  - Portable
Indirect ophthalmoscope
Indirect Ophthalmoscopy:

1. provide much wider field of view
2. less magnification (3.5X with 20D lens)
3. brighter light source – better view.
5. Allow entire retina examination till the periphery.
Disadvantage:

1. Inverted retinal image.
2. Brighter light is uncomfortable to the patient.
Special lenses:
- Goniolens
- other lenses allow evaluation of the posterior segment.
IMPORTANCE OF GONIOSCOPY
OPEN ANGLE GLAUCOMA

Symptoms
Generally the field of vision is narrowed to such a degree that one cannot see clearly.

The angle is open but drainage is defective.

CLOSED ANGLE GLAUCOMA

Symptoms
- Nausea, vomiting
- Headaches
- Intense pain in the eyes
- Bloodshot eyes and increased sensitivity
- Medium dilatation of the pupil
- Blurred vision
- Coloured circles surrounded by light

The angle between the iris and the cornea narrows or closes, blocking the drainage of the aqueous humor.
Retinoscope
Retinoscopy
A 10-year-old boy came for his annual eye check-up. Upon examination, the doctor noticed cherry red spot in the macular area. What could this sign represent?

- Hydroxychloroquine toxicity
- Niemann pick disease
- Recurrent Optic neuritis
- Severe Central Retinal Vein Occlusion
A: DIAGNOSIS
B: treatment
Thank you
