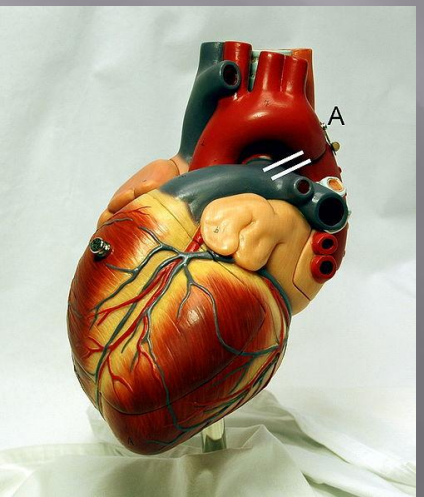
CARDIOVASCULAR SYSTEM BLOCK

CARDIAC ELECTRICAL ACTIVITY (PHYSIOLOGY)



Dr. Mona Soliman, MBBS, MSc, PhD
Associate Professor
Department of Physiology
Chair of Cardiovascular Block
College of Medicine
King Saud University

Cardiac Electrical Activity

Automaticity of the heart: the heart *is* capable of

1. **Generating** rhythmical electrical impulses
2. **Conduct** the impulses rapidly through the heart

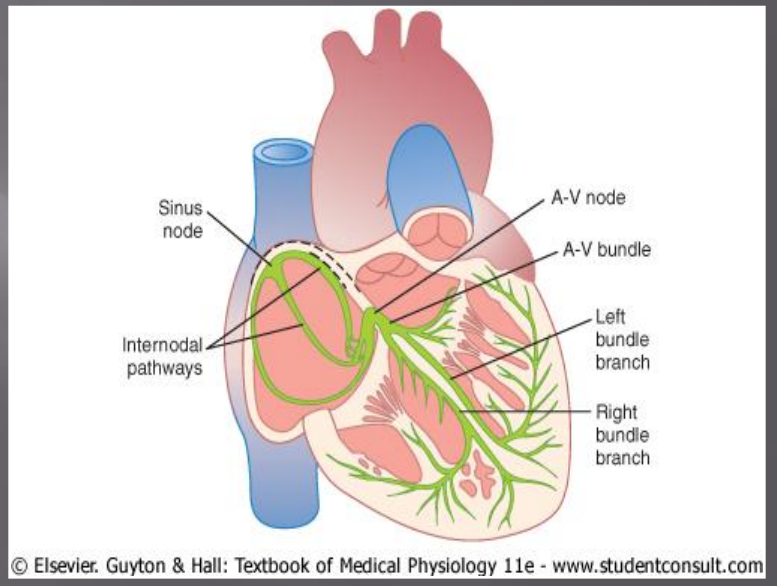
The atria contract about one sixth of a second ahead of ventricular contracti

Why?

- To allows filling of the ventricles before they pump the blood into the circulation

The Specialized Excitatory and Conductive System of the Heart

1. The sinoatrial (*S-A node*)
2. The internodal pathway
3. The atrioventricular (*A-V node*)
4. The atrioventricular bundle (*Bundle of His*)
5. *Purkinje fibers*



Conduction of Impulses

Notice that the sino-atrial node is the:
1-Pacemaker of the heart.
2-Generator of the impulse.

Sinoatrial node (S-A node):

Located in the superior lateral wall of the r[illegible] atrium near the opening of the superior v[illegible] cava

Why?

Pacemaker of the heart

Its rate of rhythmic discharge is ***greater*** than any other part in the heart

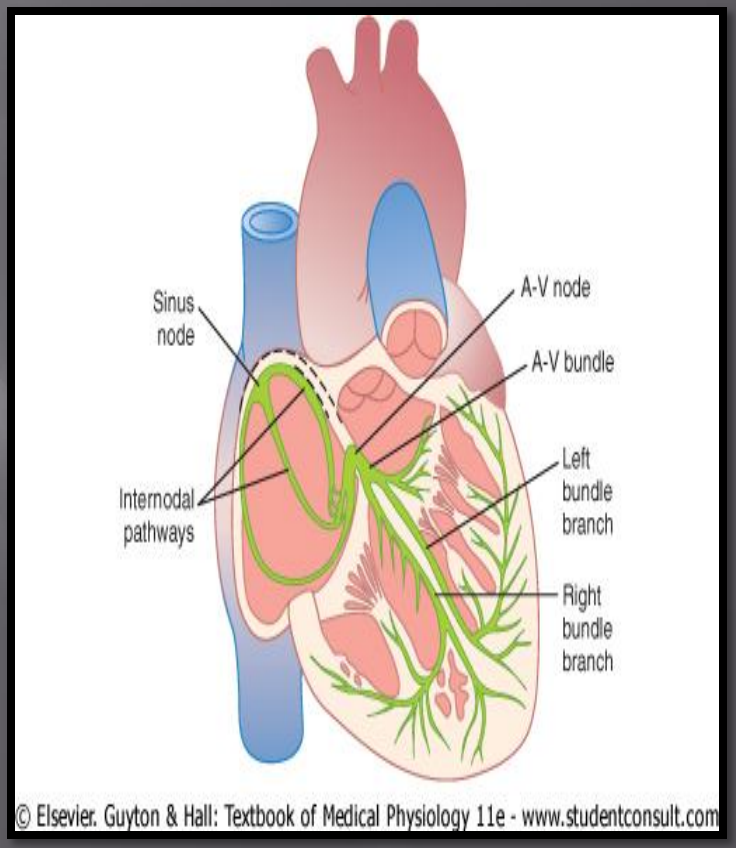
Highest frequency

Is capable of ***originating*** action potentials

Conduction of Impulses

Atrioventricular (A-V) node:

- Located in the posterior wall of the right atrium
- **Delay in the conduction of impulses** (0.1 sec)
  - Why?
- Allows time for the atria to empty the blood into the ventricles before ventricular contraction begin



Conduction of Impulses

The Purkinje System

- Purkinje fibers are very large fibers
- Transmit action potentials at a very high velocity (0.1-4.0 m/sec)

Why?

- very high permeability of gap junctions
- → ions are transmitted easily from one cell to the next
- → enhance the velocity of transmission
- Ventricular muscle contract at almost the same time

Conduction of Impulses

The Purkinje System

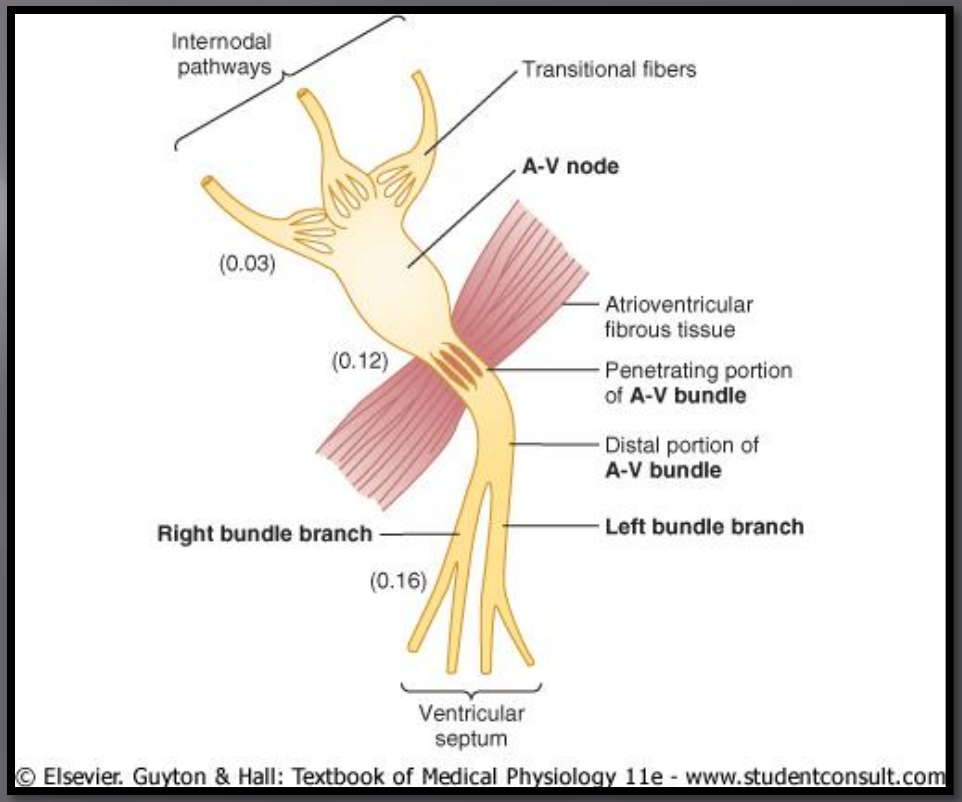
Penetrate atrioventricular fibrous tissue

→ divides into right and left bundle branches

→ each branch spread toward the apex of the heart

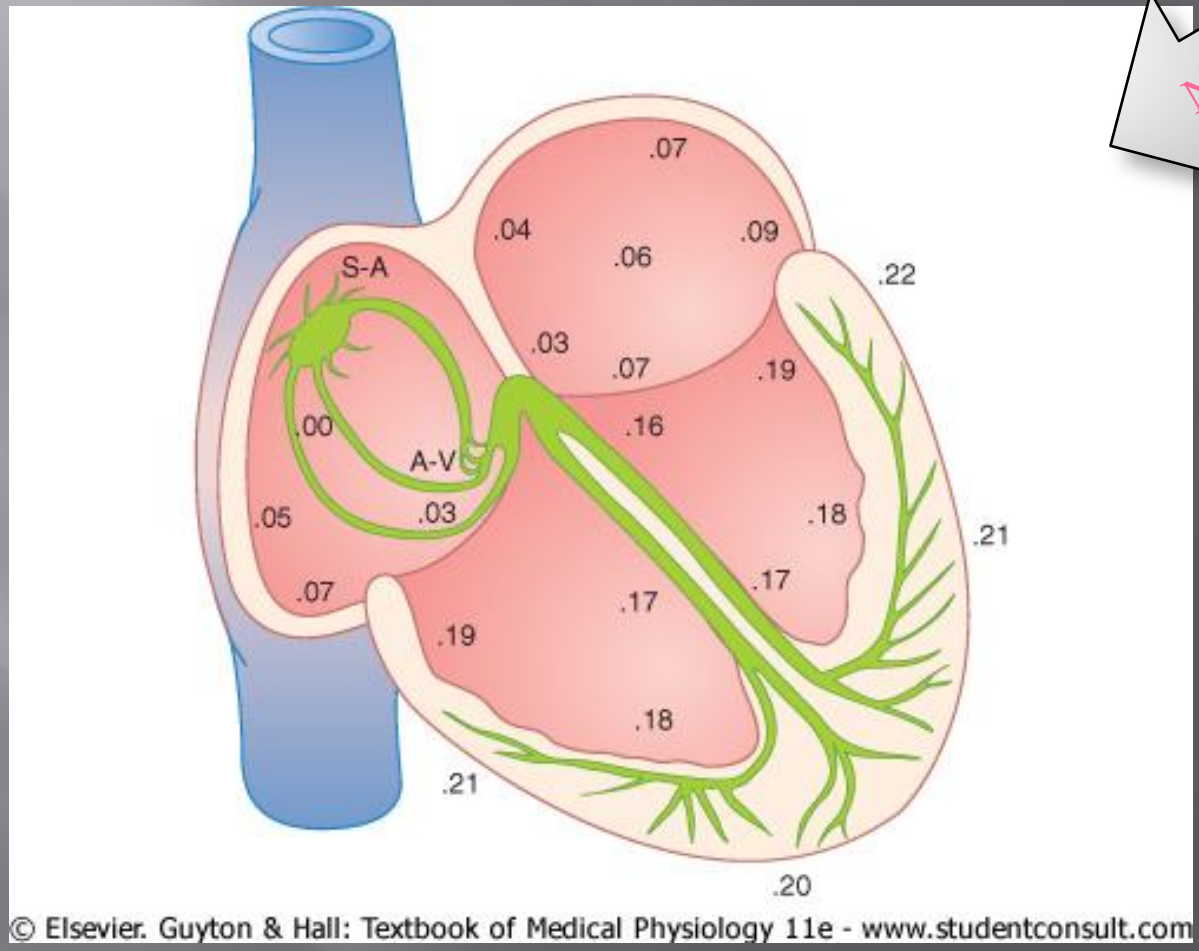
→ divide into small branches

→ penetrate and become continuous with cardiac muscle fibers



Spread of the cardiac impulse through the heart

Not Important



Control of Excitation and Conduction in the Heart

- The impulse normally arise s in the sinus node
- The Sinus Node is the **Pacemaker** of the Heart
- Its rate of rhythmical discharge is faster than that of any other part of the heart

Abnormal Pacemakers

Ectopic pacemaker: a pacemaker elsewhere than the sinus node

The cause:

Any other part of the heart develops a rhythmical discharge rate that is more rapid than that of the sinus node

Example: the A-V node or in the Purkinje fibers

Abnormal Pacemakers

٢. Blockage of transmission of the cardiac impulse from the sinus node to the other parts of the heart

Example: **A-V block**

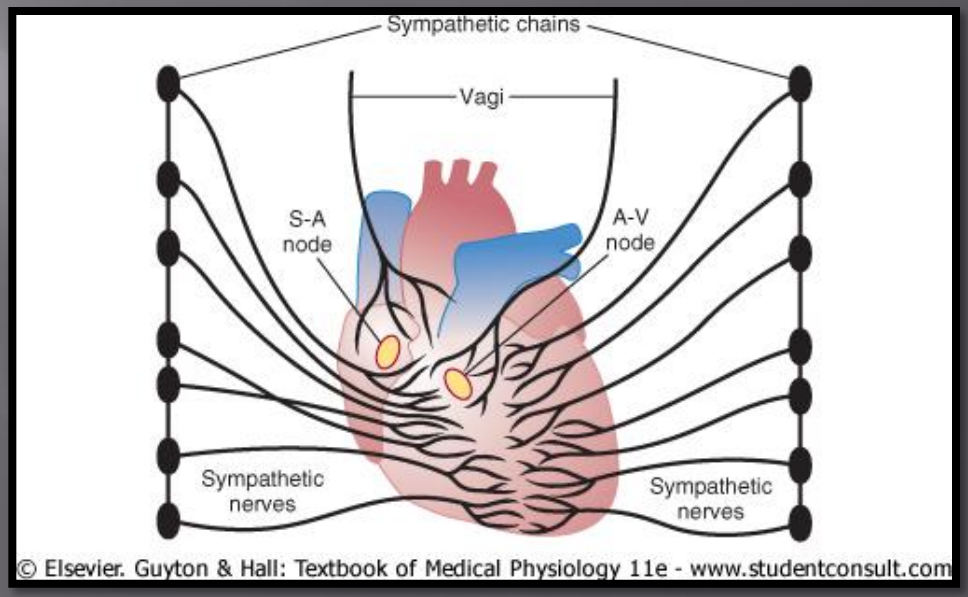
→ cardiac impulses fails to pass from atria into the ventricles

the atria continues to beat at the normal rate of → rhythm of the S-A node

a new pacemaker develops in the Purkinje system → with a new rate

Control of Heart Rhythmicity and Impulse Conduction by the Cardiac Nerves

- The heart is supplied with both sympathetic and parasympathetic nerves
- **Parasympathetic nerves (vagi):** mainly to the S-A and A-V nodes
- **Sympathetic nerves**: all parts of the heart with strong supply to the ventricles



Parasympathetic stimulation of the heart

- ↓ rate of rhythm of the S-A node
- ↓ transmission of impulses to the A-V node
- Strong stimulation of the vagi:
  - Stop completely the rhythmical excitation by the S-A node
  - Block completely transmission of cardiac impulses from the atria to the ventricle
  - Some point in the Purkinje fibers develops a rhythm of its own

"Ventricular Escape"

Sympathetic Stimulation Of The Heart..

- ↑ rate of rhythm of the S-A node
- ↑ transmission of impulses to the A-V node
- ↑ force of contraction

Questions:

1)which statement is correct according to S-A node?

a)It has the highest rate if the rhythmic discharge ..

b)Delay in the conduction of impulse..

c)Transmit AP at very high velocity..

Sympathetic stimulation of the heart leads to:

a)decrease rate of rhythm of the S-A node..

b) increase force of contraction..

c)decrease transmission of impulses to the A-v node..

Good Luck..
