

# BIOCHEMISTRY TEAM ..

## Biochemical markers in disease diagnosis

# biochemical markers

- What is a biomarker?
- Enzymatic diagnosis and prognosis of a disease
- Enzymes as markers of disease: **Amylase, ALT, AST**
- Plasma proteins as markers of disease: **Albumin**
- Tumor markers:  **$\alpha$ -fetoprotein, PSA**

# what is a biomarker?

## biomarker

- **A biological molecule found in blood, other body fluids, or tissues that indicates a normal or abnormal process such as a disease or a condition**
- **A biomarker is measured to follow up a disease or treatment**

\*Follow up means: Looking after the patient status before & after the treatment.

# diagnosis and prognosis ?

- **Diagnosis**
- **Identification of a disease from its signs and symptoms.**
  
- **Prognosis:**
- **The future outcome of a disease.**

- enzymatic diagnosis & prognosis of disease

**Enzymes are used clinically in three ways:**

**As indicators of enzyme activity or conc. in body fluids (serum, urine) in the diagnosis/prognosis of a disease  
(Markers)**

**As therapeutic agents  
(Drugs)**

**As analytical reagents in measuring activity of other enzymes or compounds in body fluids  
(Reagents to measure other enzymes)**

## ❖ Most common body fluids: serum and plasma

### • **Enzymes are:**

#### Plasma-specific enzymes

- **Normally present in plasma**
- **Perform their functions in blood**
- **High level of activity in plasma than in tissue cells**
- **Examples: blood clotting enzymes (thrombin), cholinesterase, etc.**

#### Non-plasma-specific enzymes

- Present inside the cell(tissues)
- Conc. is lower in plasma
- Released into the body fluids in high conc. due to:
  - cell damage
  - defective cell membrane

- 
- Intracellular enzymes are present only in their cells of origin.
  - Some are secretory enzymes that are secreted by salivary glands, gastric mucosa and pancreas.
  - In disease, plasma levels of secretory enzymes increase when their cells are damaged.
  - The diagnosis of organ disease is done by measurement of enzymes of that tissue.

\*if you have an organ disease , you have to check if there is any problem with the enzymes

**Enzyme inhibitors**

**Rate of enzyme synthesis  
and clearance**

**Glucose deficiency**

**Cell damage**

**factors  
affecting  
serum enzyme  
levels**

**Necrosis**

**Localized  
hypoxia (less  
oxygen)**

**Myocardial  
infarction**

**Ischemia (obstruction  
of blood vessels)**

**Tissue infarction due  
to ischemic necrosis**

# ◦ Enzymatic markers ..

## Amylase

- Elevated serum amylase level is a diagnostic indicator of acute pancreatitis
  - Amylase level greater than 10 times the upper limit indicates acute pancreatitis
- The test has low specificity because elevated serum amylase level is also present in other diseases
- Amylase appears in the serum within 2-12 hours after abdominal pain
- Free amylase (unbound form) is rapidly cleared by the kidneys

## Alanine aminotransferase (ALT)

- **Mostly present in liver**
- **Small amounts in heart**
- More specific for liver disease than AST
- Major diagnosis: liver disease

## Aspartate aminotransferase (AST)

- **Widely distributed in heart, liver, skeletal muscle, kidney**
- **Small amounts in erythrocytes**
- **High serum activity of AST found in:**
  - Liver disease, heart disease, skeletal muscle disease, hemolysis
- **Major diagnosis: myocardial infarction, liver and muscle diseases**

# ○ Amylase in acute pancreatitis

**Acute pancreatitis is the inflammation of pancreas caused by:**

- Obstruction of the pancreatic duct.
- Gallstones ( **main cause of acute pancreas**).
- Alcohol abuse.

- Abnormal release of pancreatic enzymes and their premature activation
- The main pancreatic enzyme is trypsinogen
- **Trypsinogen is activated to trypsin**
- Trypsin converts other enzymes to active form such as kallikrein, phospholipase A<sub>2</sub>, elastase, etc.
- Effects of abnormal release of enzymes: autodigestion of pancreas, vasodilation, respiratory failure, etc

## **Enzymatic diagnosis**

Measurement of pancreatic enzymes:

- Amylase
- Lipase
- Trypsinogen

# High ALT and AST in liver diseases ..

- Alcohol abuse
- Medication
- Chronic hepatitis B and C
- Steatosis and steatohepatitis
- Autoimmune hepatitis
- Wilson's disease
- $\alpha$ 1-antitrypsin deficiency
- Malignancy
- Poisons and infectious agents

# Serum enzymes used in the assessment of liver function:

## Markers used in hepatocellular necrosis

- Alanine aminotransferases
- Aspartate aminotransferases

## Markers used in cholestasis

- Alkaline phosphatase
- 5'-nucleotidase-
- $\gamma$ -glutamyl transferase

# plasma proteins as markers (albumin) ..

## ❖ Functions

**1- Oncotic pressure** (pressure exerted by plasma proteins that pulls water into the circulatory system) = **(remember the osmotic)**

- 80% of plasma oncotic pressure is maintained by albumin.
- Fluid distribution in and outside cell, plasma volume.

**2- Buffering** – some buffering function.

**3- Transport** – lipid-soluble molecules, hormones, calcium, drugs, etc. in Blood.

# Plasma Proteins As Markers ..

<b>Hypoalbuminemia</b>		<b>Hyperalbuminemia</b>
<b>Causes</b>	<b>Effects</b>	<b>causes</b>
<p>Decreased albumin synthesis – failure of synthesis due to genetic reasons and malnutrition</p> <p>Increased volume of albumin distribution – in liver disease</p> <p>Increased losses of albumin – increased catabolism in infections, nephrotic syndrome, hemorrhage, severe burns, etc.</p>	<p>Edema due to low oncotic pressure -Albumin level drops in liver disease causing low oncotic pressure (to hold fluids within cells)</p> <p>-Fluid moves into the interstitial spaces causing edema</p> <p>Reduced transport of -Substances in plasma. -Drugs (free form – more active).</p>	<p>Dehydration is a major cause of hyperalbuminemia</p>

# TUMOR MARKERS..

- A molecule secreted by a tumor that is measured for diagnosis and management of a tumor.

<b><math>\alpha</math>-fetoprotein</b>	<b>Prostate specific antigen (PSA)</b>
<ul style="list-style-type: none"><li>• In newborn babies <math>\alpha</math>-fetoprotein levels are very low.</li><li>• High conc. are observed in:<ul style="list-style-type: none"><li>➤ hepatocellular carcinomas (hepatoma).</li><li>➤ testicular carcinomas.</li><li>➤ GI tract carcinomas.</li></ul></li><li>• However, high serum levels are also found in benign (non-cancerous) conditions e.g. <b>hepatitis</b></li><li>• High conc. are not always suggestive of tumor.</li></ul>	<ul style="list-style-type: none"><li>• A serine protease enzyme also called kallikrein III, seminin.</li><li>• Produced by prostate gland.</li><li>• Liquefies ejaculate.</li><li>• High serum PSA levels are observed in prostate cancer.</li><li>• Less specific in diagnosis. *High serum levels are also observed in benign prostatic hypertrophy (enlarged prostate gland)</li></ul>

# Student notes:

- 1) Albumin: Is a plasma protein marker.
- 2) (PSA) : Prostate Specific Antigen.
- 3) Enzymes are found in plasma normally.
- 4) Every tissue have a specific marker.
- 5) Enzyme inhibitor  $\uparrow$  = more enzyme  $\downarrow$  & (Vice versa).
- 6) Diagnosis based on: - Markers. - Clinical activities.
- 7) Markers goals are: - Follow up. - diagnose a disease.
- 8) Low Albumin = Edema.
- 9)  $\alpha$ -fetoprotein is not specific.
- 10) When patient have a prostate cancer = the patient have a high amount of PSA.
- 11) When the marker is less specific, its need a combination with other marker. (That will help us to reach to a specific tissue)

Thank  
You

Biochemistry team wish you good luck ..

**\*If you take life  
casually, it will take  
you casually.**
