

# **Cell Signaling and Regulation of Metabolism**

**By**

**Dr. Reem M. Sallam, *MD, PhD***

**Clinical Chemistry Unit  
Department of Pathology**

# Objectives

- **Different steps in signaling pathways**
- **The second messenger systems**
- **Function of signaling pathways for**
  - **Signal transmission**
  - **Amplification**
- **The role signaling pathways in regulation and integration of metabolism**

# No cell lives in isolation

- **Cells communicate with each other**
- **Cells send and receive information (signals)**
- **Information is relayed within cell to produce a response**

# Signaling Process

- **Recognition of signal**
  - **Receptors**
- **Transduction**
  - **Change of external signal into intracellular message with amplification and formation of second messenger**
- **Effect**
  - **Modification of cell metabolism and function**

# Signaling Process

- **Recognition of signal**
  - **Receptors**
- **Transduction**
  - **Change of external signal into intracellular message with amplification and formation of second messenger**
- **Effect**
  - **Modification of cell metabolism and function**

# General Signaling Pathway

# Signaling Cascades

# Recognition

- **Performed by receptors**
- **Ligand will produce response only in cells that have receptors for this particular ligand**
- **Each cell has a specific set of receptors**

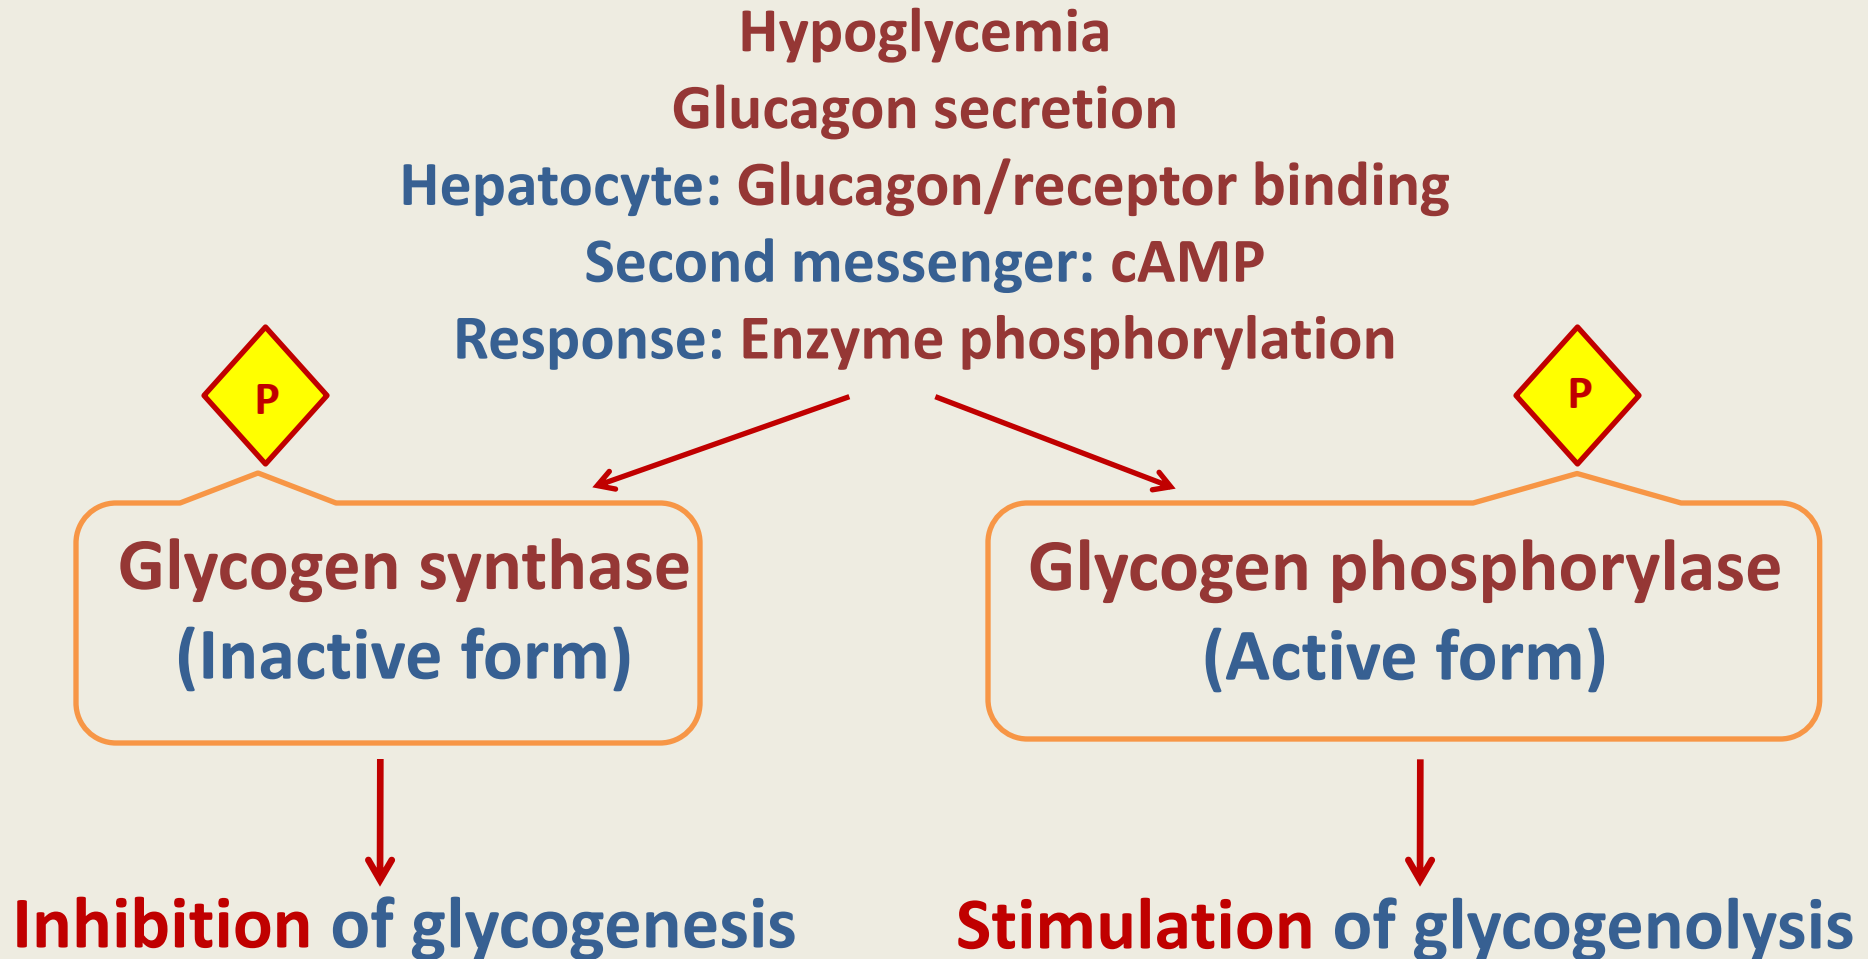

# Different Responses to the Same Signaling Molecule

## (A) Different Cells

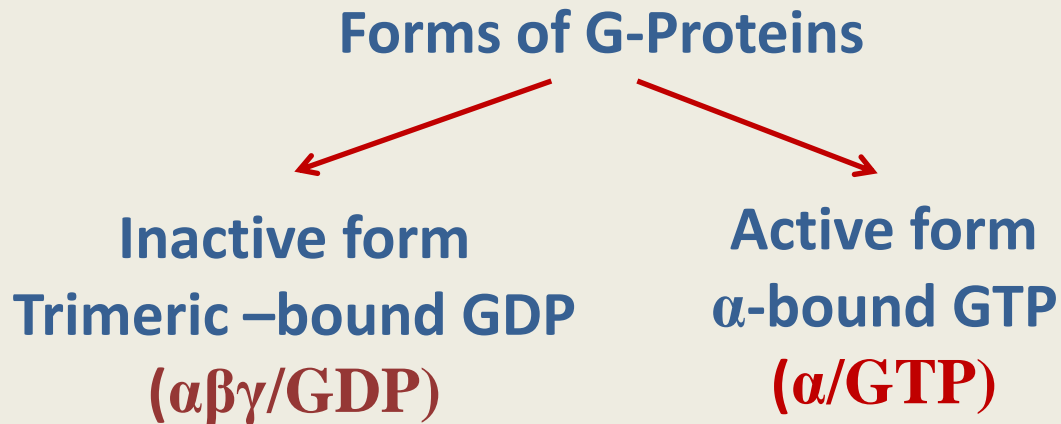

# Different Responses to the Same Signaling Molecule

## (B) One Cell but, Different Pathways

# GTP-Dependant Regulatory Proteins (G-Proteins)

**G-Proteins:** Trimeric membrane proteins ( $\alpha\beta\gamma$ )  
G-stimulatory ( $G_s$ ) and G-inhibitory ( $G_i$ )  
Binds to GTP/GDP

The  **$\alpha$ -subunit** has **intrinsic GTPase activity**, resulting in hydrolysis of GTP into GDP and inactivation of G-proteins

# Signaling Pathways for Regulation of Metabolism

Two important second messenger systems:

**Adenylyl cyclase system**

**Calcium/phosphatidylinositol system**

# Adenylyl cyclase

**Adenylyl cyclase:** Membrane-bound enzyme  
Converts ATP to cAMP

**Activation/Inhibition:**

**Signal:** Hormones or neurotransmitters  
(e.g., Glucagon and epinephrine)  
or Toxins

(e.g., Cholera and pertussis toxins)

**Receptor:** G-protein coupled receptor

**Response:** Activation/inhibition of protein kinase A  
(cAMP-dependent protein kinase)

# Signal Transduction: Adenylyl Cyclase System

**Resting state: No Signal**

**Ligand/Receptor Binding  
Activation of  $G_s$ -protein**

# Signal Transduction: Adenylyl Cyclase System

**Activation of adenylyl cyclase**

# Adenylyl Cyclase System: cAMP-Dependent Protein Kinase (Protein Kinase A)

**\*Phosphodiesterase**

# Termination of Signal (A)

\*Phosphodiesterase

•Protein phosphatase

•Phosphodiesterase → ↓cAMP → Inactive protein kinase

# Termination of Signal (B)

# Termination of Signal (C)

# G-Protein Coupled Membrane Receptor

# Regulation of Glycogen Metabolism by Glucagon: Effects on Glycogen Synthase and Phosphorylase

Hypoglycemia

Glucagon secretion

Hepatocyte: Glucagon/receptor binding

Second messenger: cAMP

Response: Enzyme phosphorylation

Glycogen synthase  
(Inactive form)

Glycogen phosphorylase  
(Active form)

Inhibition of glycogenesis

Stimulation of glycogenolysis

# Pyruvate Kinase Regulation: Covalent Modification

# Calcium/Phosphatidylinositol System

# Calcium/Phosphatidylinositol System

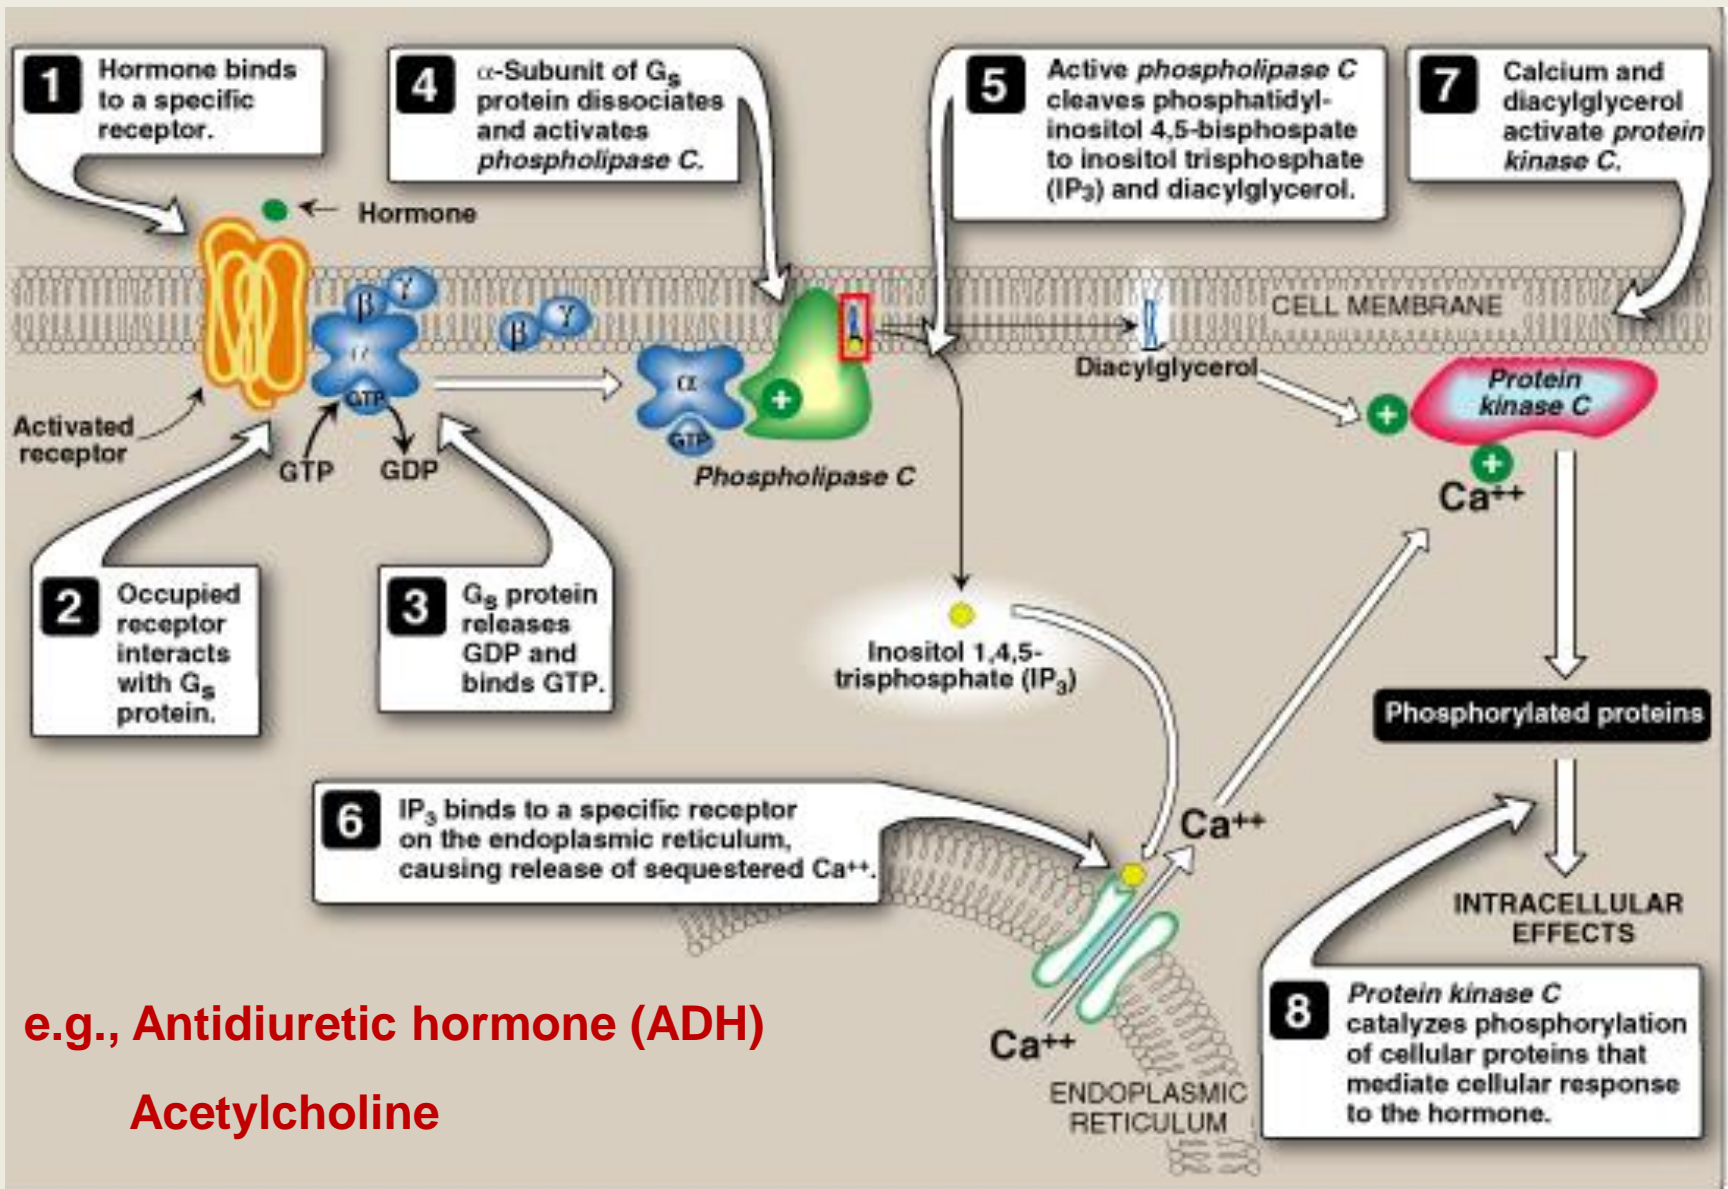

Diacylglycerol (DAG)

Inositol Trisphosphate (IP<sub>3</sub>)

Phospholipase C

# Intracellular Signaling by Inositol trisphosphate

# Take Home Message

Cell signaling allows

- Signal transmission and amplification
- Regulation of metabolism
- Intercellular communications & coordination of complex biologic functions
