Department of Physiology

College of Medicine

King Saud University

LECTUR (1)

Functional Anatomy & Physiology of Autonomic NS

INTRODUCTION

THE NERVOUS SYSTEM

- **INTRODUCTION**
- **The nervous system monitors and controls almost every organ / system through a series of positive and negative feedback loops.**
- **The Central Nervous System (CNS): Includes the brain and spinal cord.**
- **The Peripheral Nervous System (PNS): Formed by neurons & their process present in all the regions of the body.**
- **It consists of cranial nerves arises from the brain & spinal nerves arising from the spinal cord.**
- **The peripheral NS is divided into**
- **Somatic Nervous system**
- **Autonomic nervous system**

OBJECTIVES

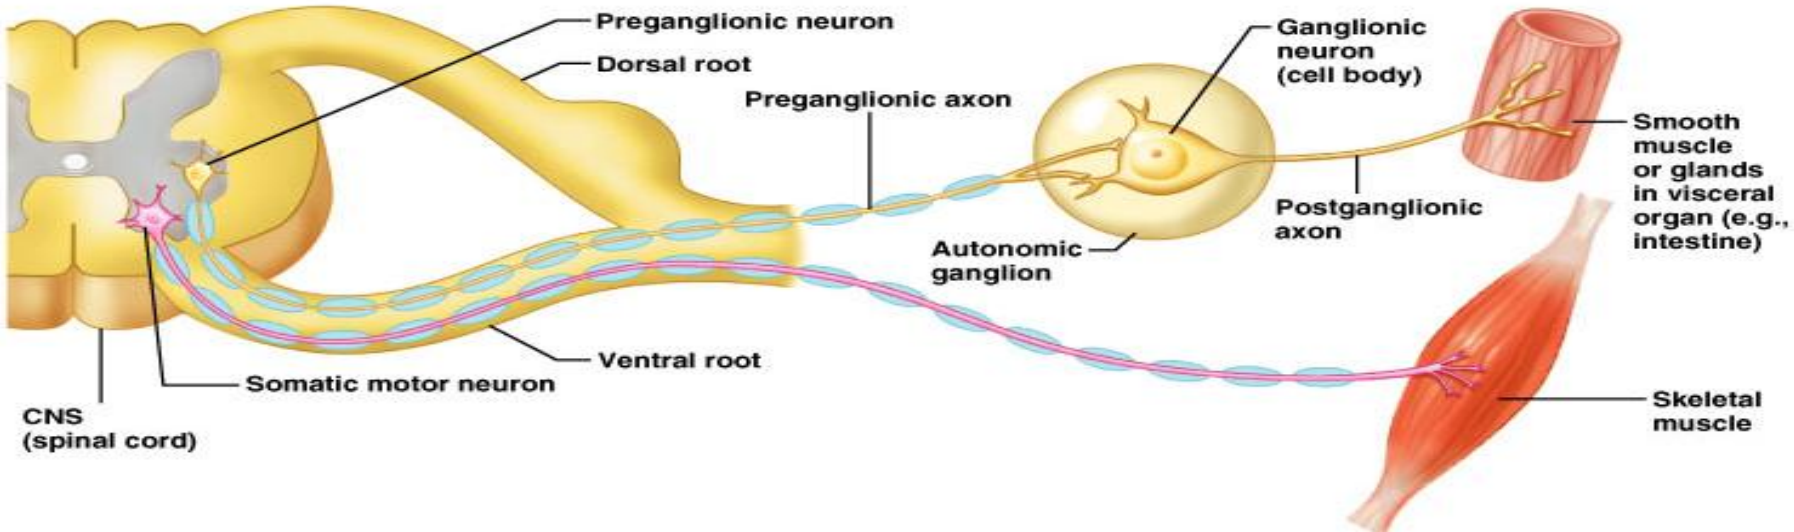
- **Anatomy and physiology of Autonomic Nervous System**
- At the end of this lectutre (1)the student should be able to:-
- -appreciate the anatomy of sympathetic& parasympathetic nervous system.
- -explain physiological functions of Sympathetic &parasympathetic nerves in head&neck,chest,abdomen and pelvis

FUNCTIONAL ANATOMY OF THE AUTONOMIC NERVOUS SYSTEM

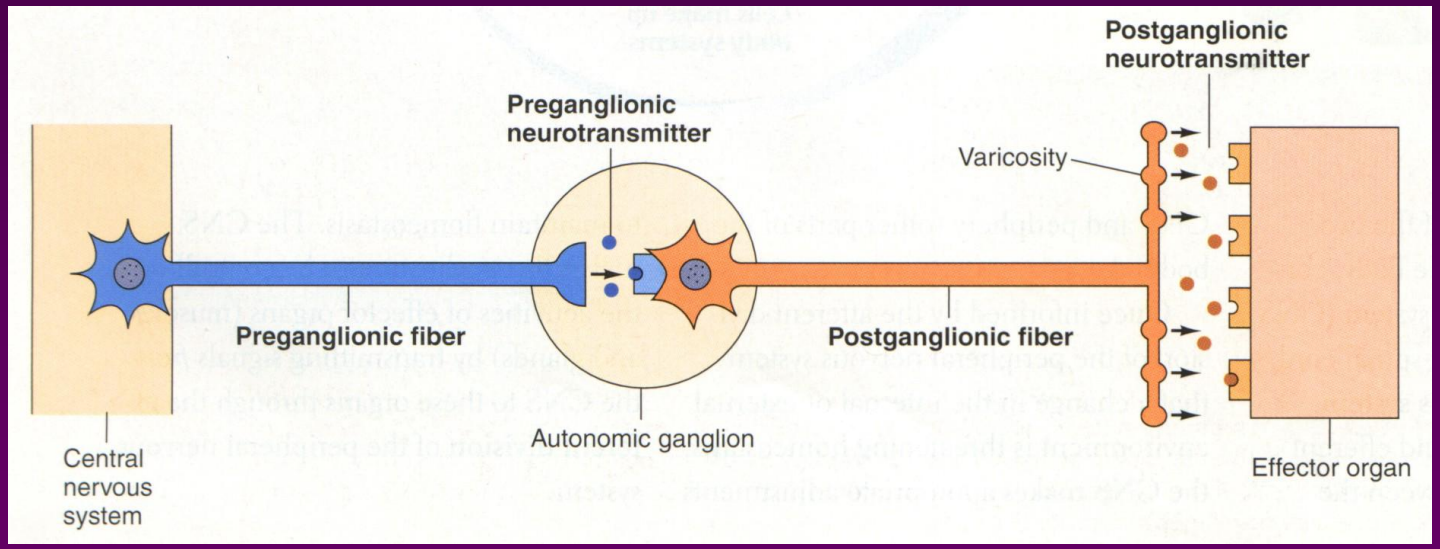
Basic anatomical difference between the motor pathways of the voluntary somatic nervous system (to skeletal muscles) and those of the autonomic nervous system

- Somatic division:
  - Cell bodies of motor neurons reside in CNS (brain or spinal cord)
  - Their axons (sheathed in spinal nerves) extend all the way to their skeletal muscles
- Autonomic system: chains of two motor neurons
  - 1st = preganglionic neuron (in brain or cord)
  - 2nd = gangionic neuron (cell body in ganglion outside CNS)
  - Slower because lightly or unmyelinated

Basic anatomical difference between the motor pathways of the voluntary somatic nervous system (to skeletal muscles) and those of the autonomic nervous system



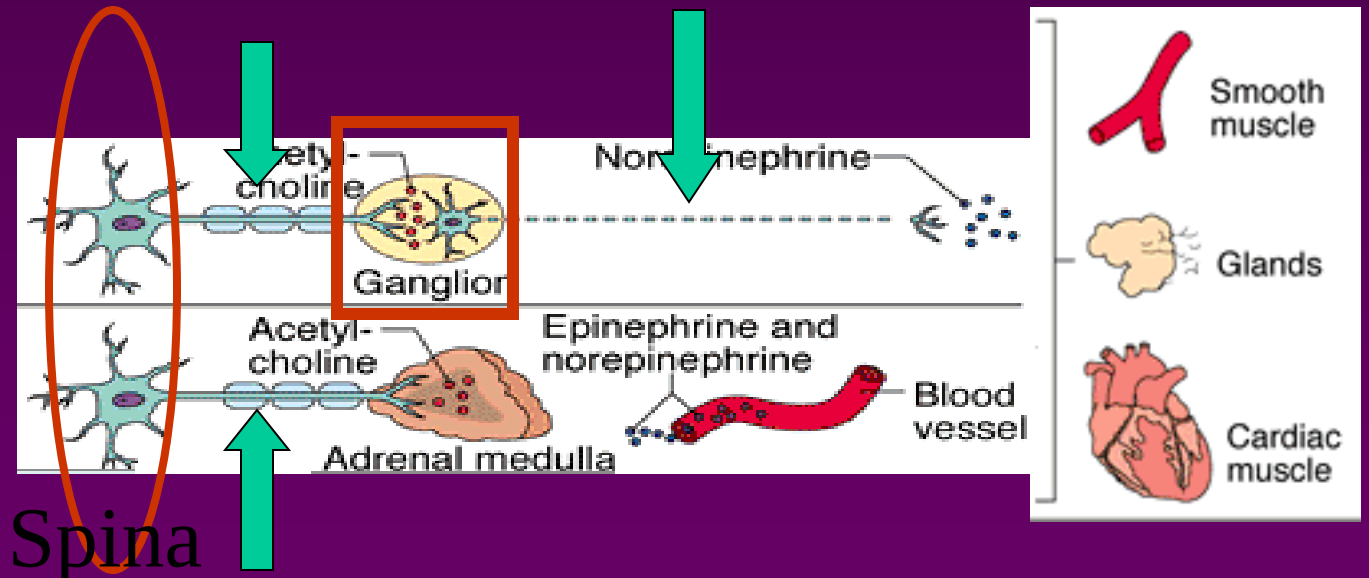
- Axon of 1st (*preganglionic*) neuron leaves CNS to synapse with the 2nd (*ganglionic*) neuron
- Axon of 2nd (*ganglionic*) neuron extends to the organ it serves



Sympathetic

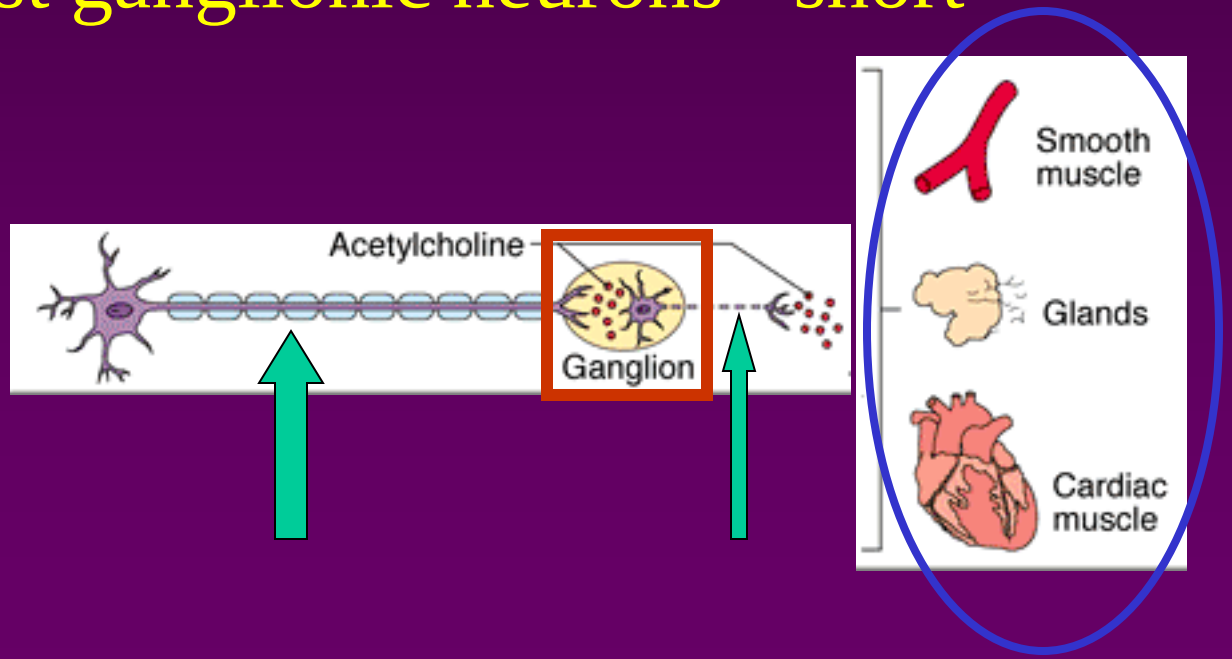
Innervation of Visceral Targets

- Short, lightly myelinated preganglionic neurons
- Long, unmyelinated postganglionic neurons
- Ganglia close to spinal cord

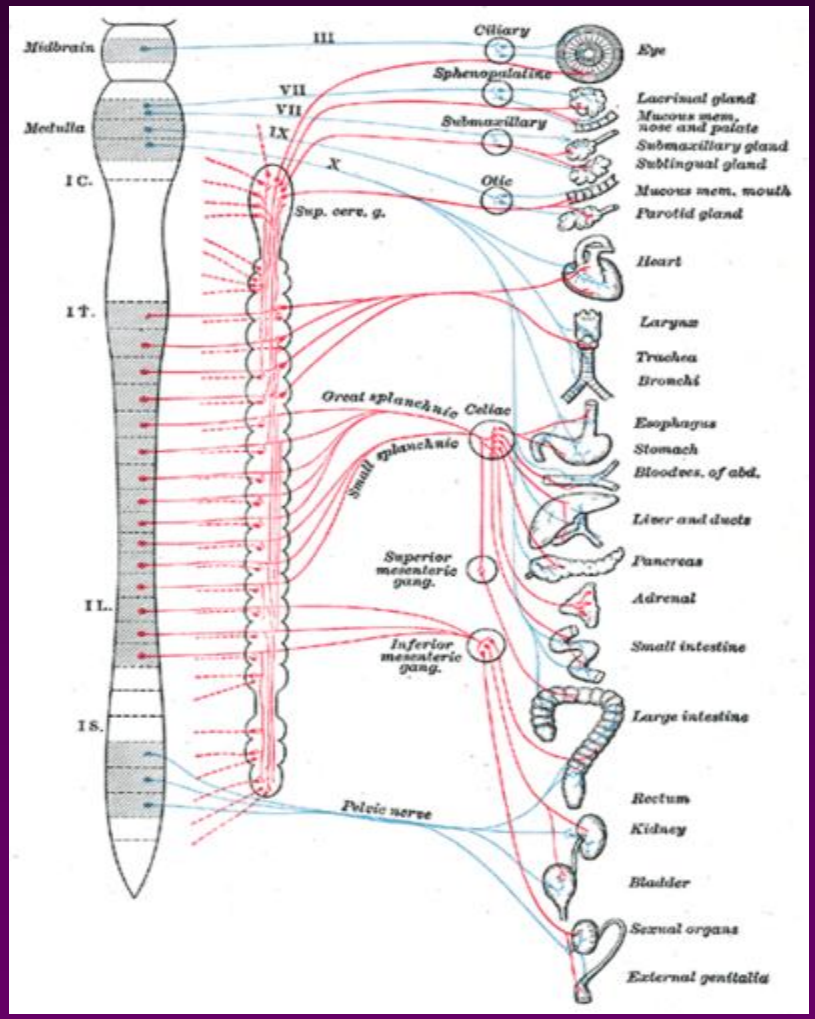


Parasympathetic
Innervation of Visceral Targets

- Ganglia close to or on target organs
- Preganglionic neurons - long
- Post ganglionic neurons - short



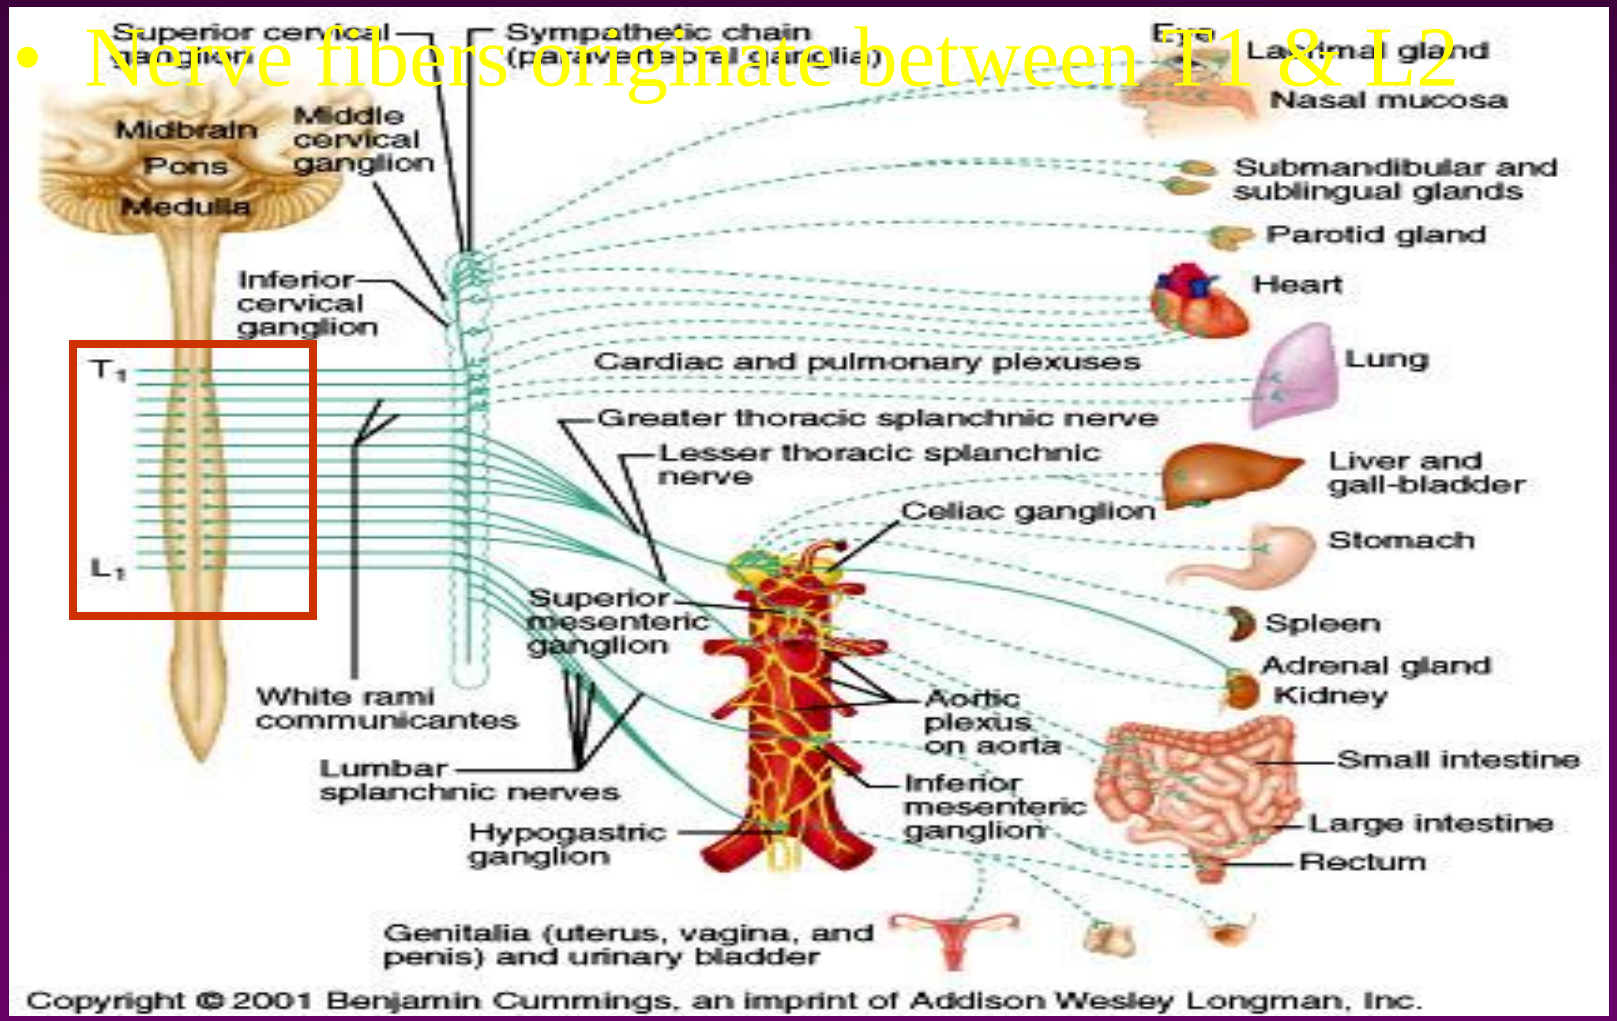
SYMPATHETIC & PARASYMPATHETIC NERVOUS SYSTEM ORIGIN



Blue= Para symp; Red symp

Sympathetic - Origin

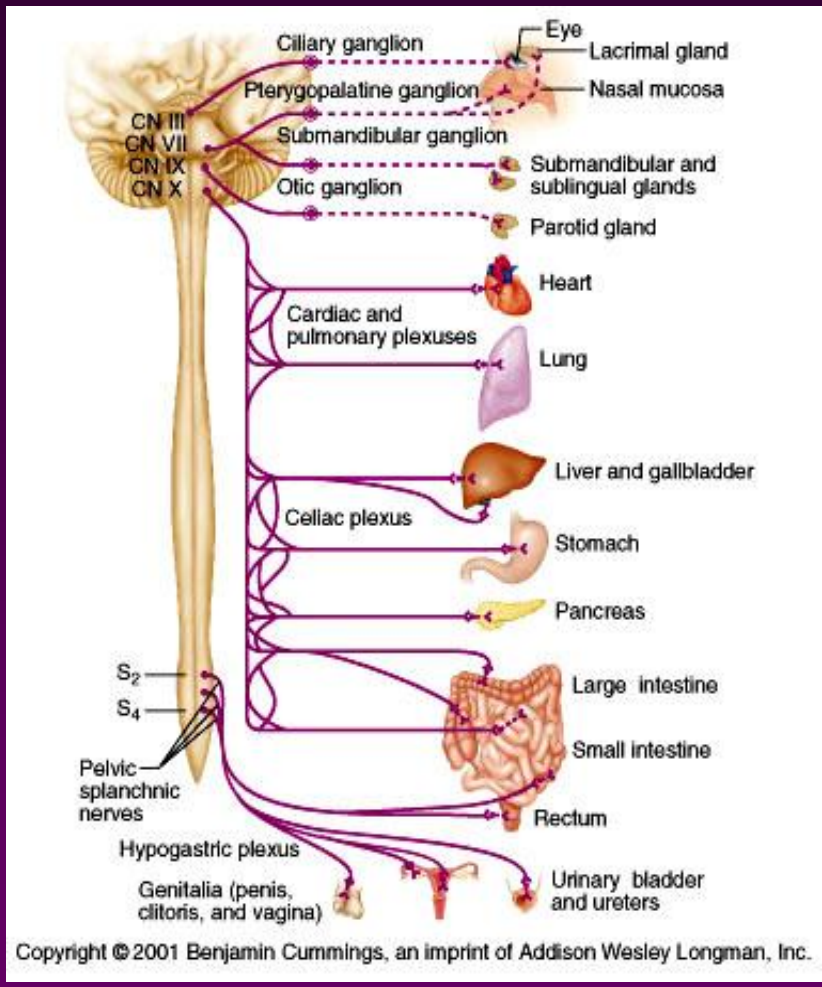
- Thoracolumbar **lateral horns of the spinal segments T1-L2.**
- Nerve fibers originate between T1 & L2



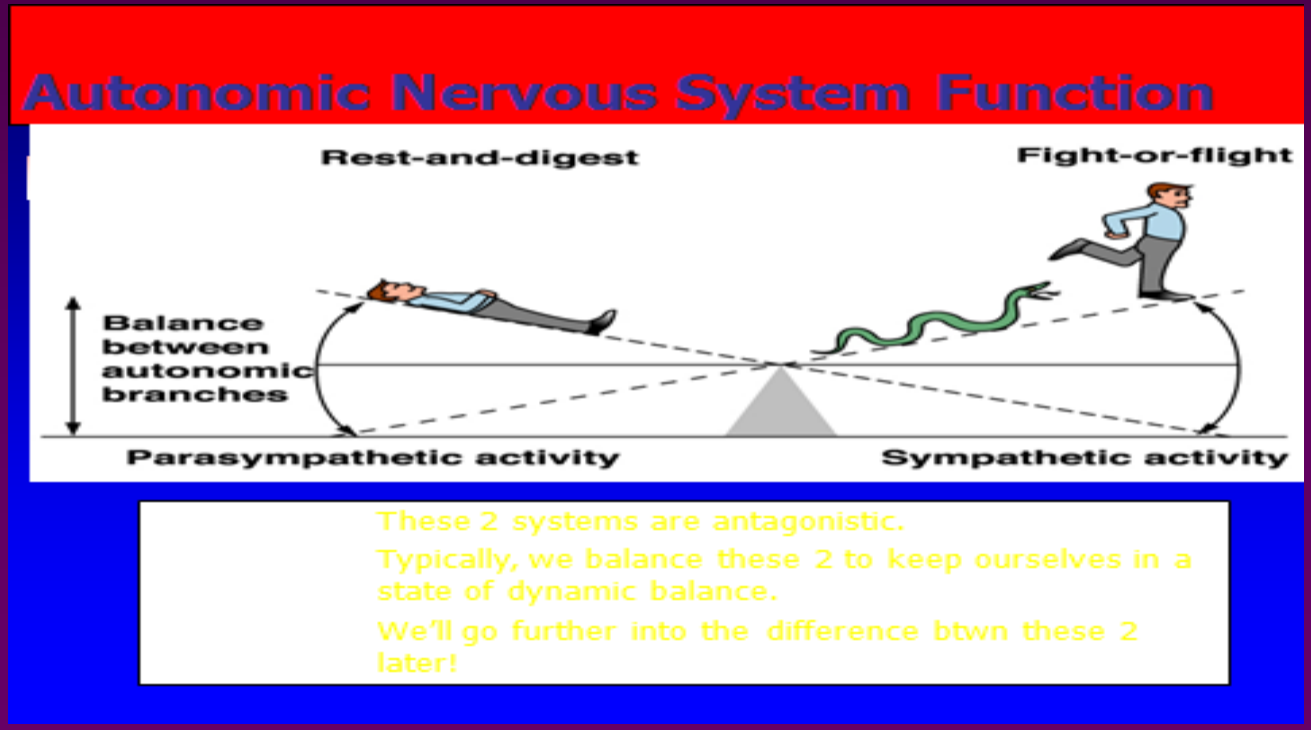
Parasympathetic - Origin

- Craniosacral Cell bodies of the motor nuclei of the cranial nerves III, VII, IX and X in the brain stem
- Second, third and fourth [S2-S4] sacral segments of the spinal cord

- Nerve fibers emerge from brain &
- sacrum cranio-sacral outflow



PHYSIOLOGICAL FUNCTIONS OF THE AUTONOMIC NERVOUS SYSTEM



THE AUTONOMIC NERVOUS SYSTEM

Subdivision	Nerves Employed	Location of Ganglia	Chemical Messenger	General Function
Sympathetic	Thoracolumbar	Alongside vertebral column	Norepinephrine	Fight or flight
Parasympathetic	Craniosacral	On or near an effector organ	Acetylcholine	Conservation of body energy

PHYSIOLOGICAL FUNCTIONS OF THE AUTONOMIC NERVOUS SYSTEM

The Autonomic Nervous System

Structure	Sympathetic Stimulation	Parasympathetic Stimulation
Iris (eye muscle)	Pupil dilation	Pupil constriction
Salivary Glands	Saliva production reduced	Saliva production increased
Oral/Nasal Mucosa	Mucus production reduced	Mucus production increased
Heart	Heart rate and force increased	Heart rate and force decreased
Lung	Bronchial muscle relaxed	Bronchial muscle contracted

The Autonomic Nervous System

Structure	Sympathetic Stimulation	Parasympathetic Stimulation
Stomach	Peristalsis reduced	Gastric juice secreted; motility increased
Small Intes	Motility reduced	Digestion increased
Large Intes	Motility reduced	Secretions and motility increased
Liver	Increased conversion of glycogen to glucose	
Kidney	Decreased urine secretion	Increased urine secretion
Adrenal medulla	Norepinephrine and epinephrine secreted	
Bladder	Wall relaxed Sphincter closed	Wall contracted Sphincter relaxed

THANK YOU

LECTUR (2)

MECHANISM OF ACTIONS

The neurotransmitters & receptors of Autonomic NS

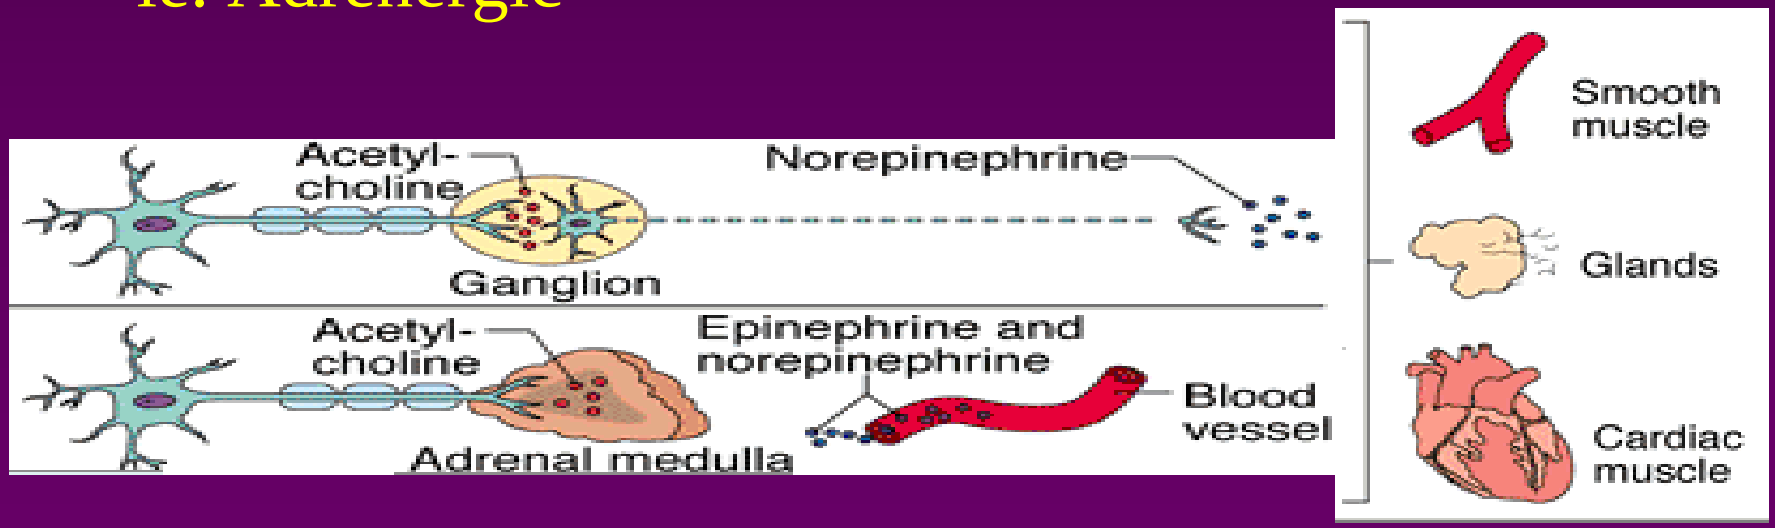
OBJECTIVES

OBJECTIVES

- describe neurotransmitters that can release at pre and post ganglionic of Autonomic NS.
- Describe Autonomic NS receptors.

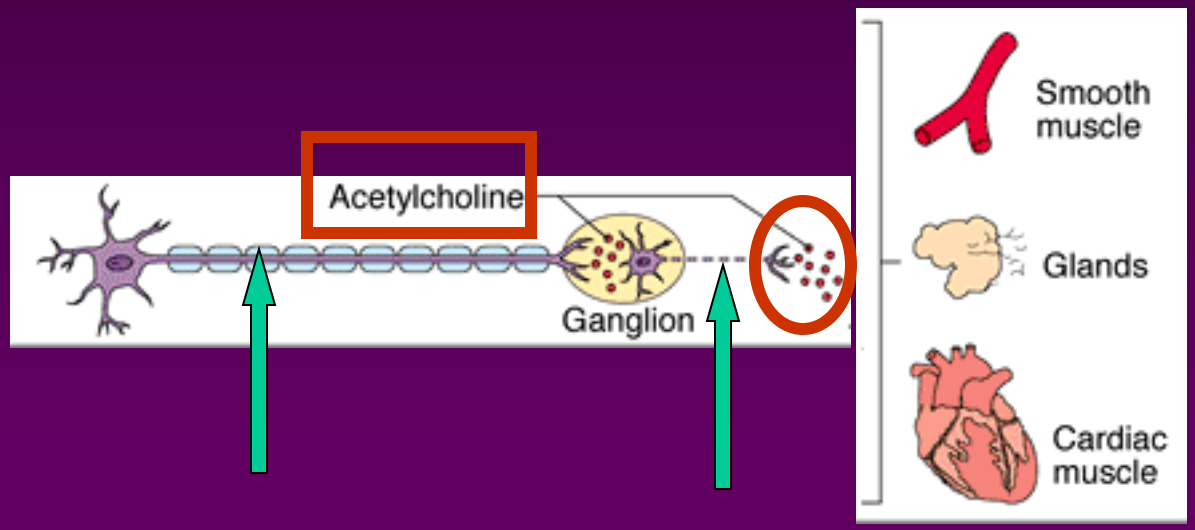
Sympathetic Neurotransmitters

- Preganglionic neurons -
- Cholinergic = (release acetylcholine)
- Postganglionic neurons:
  - release norepinepherine at target organs
  - ie. Adrenergic



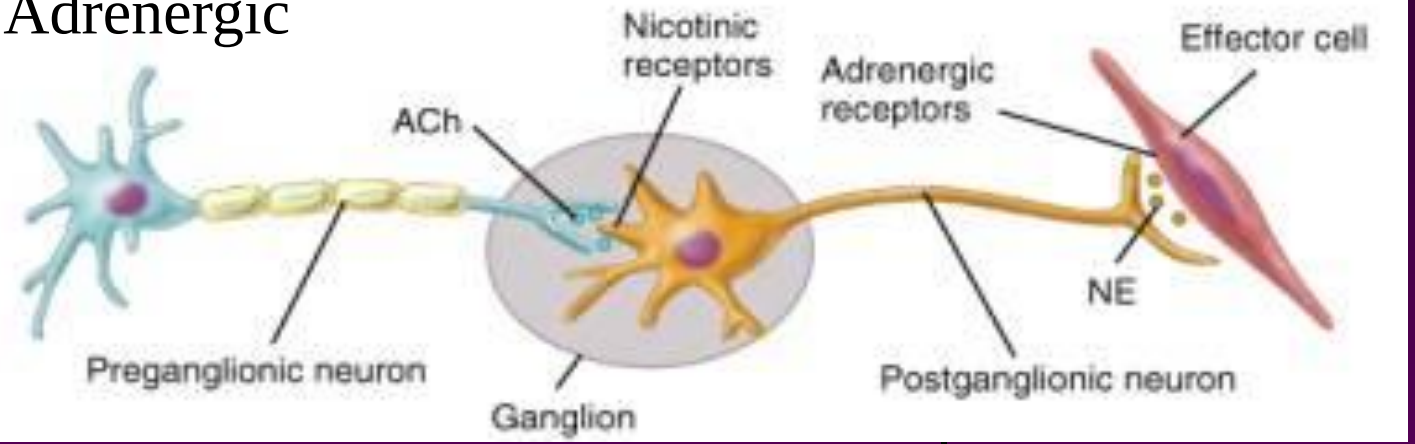
Parasympathetic Neurotransmitters

- Pre & Postganglionic neurons release acetylcholine = Cholinergic

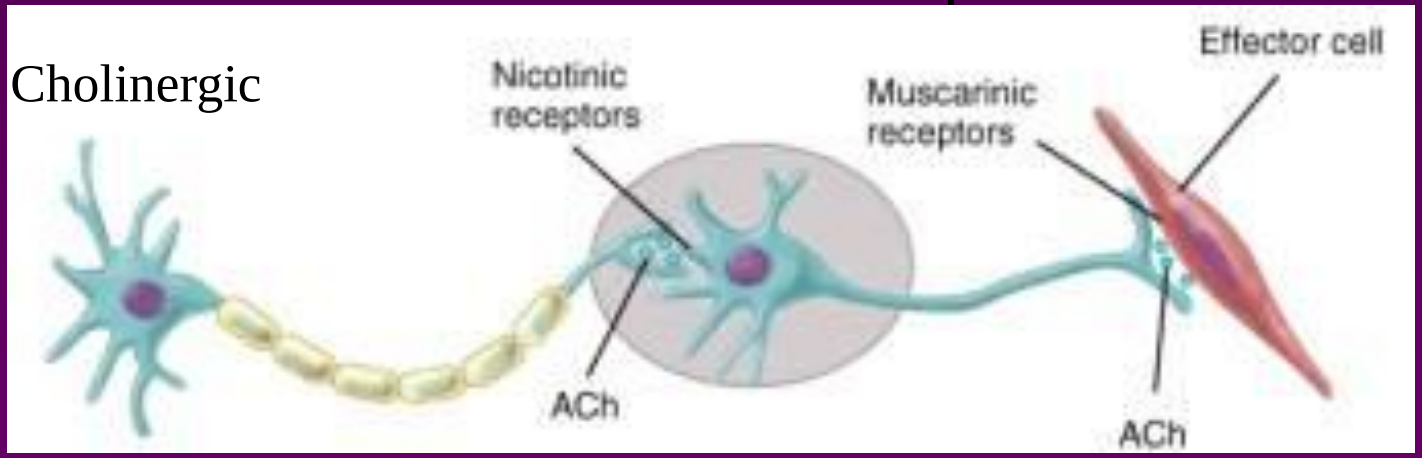


ANS Neurotransmitters: Classified as either cholinergic or adrenergic neurons based upon the neurotransmitter released

Adrenergic



Cholinergic



Chemical or neural transmitter

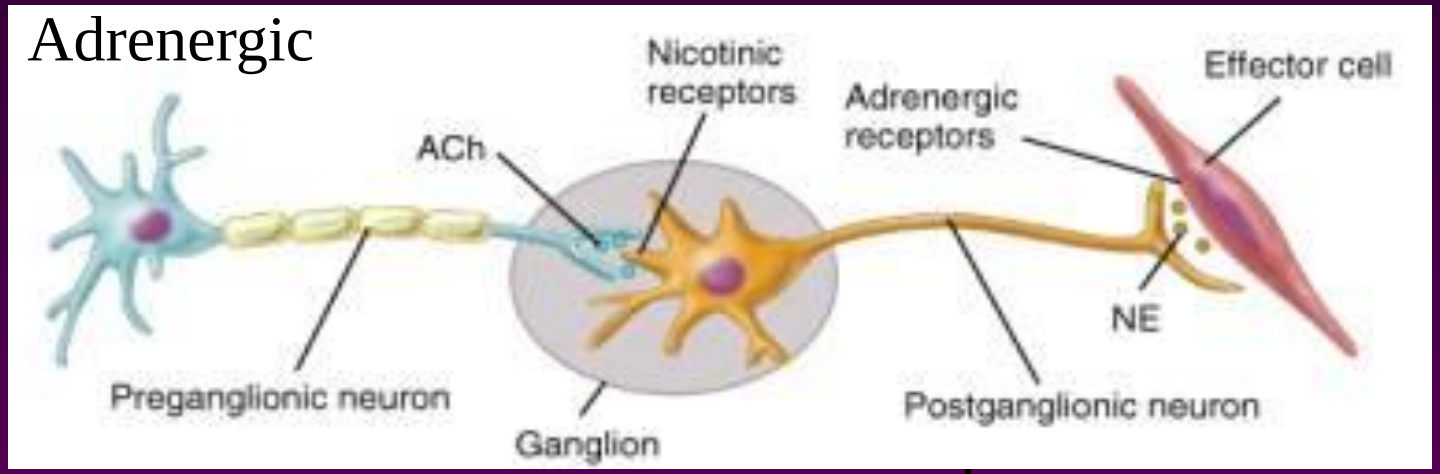
- All **preganglionic** fibers release **acetylcholin (Ach).**
- All **parasympathetic postganglionic** release **Ach.**
- All **sympathetic postganglionic** release **noradrenalin except sweat glands & bl vessels to skeletal muscles**

RECEPTORS

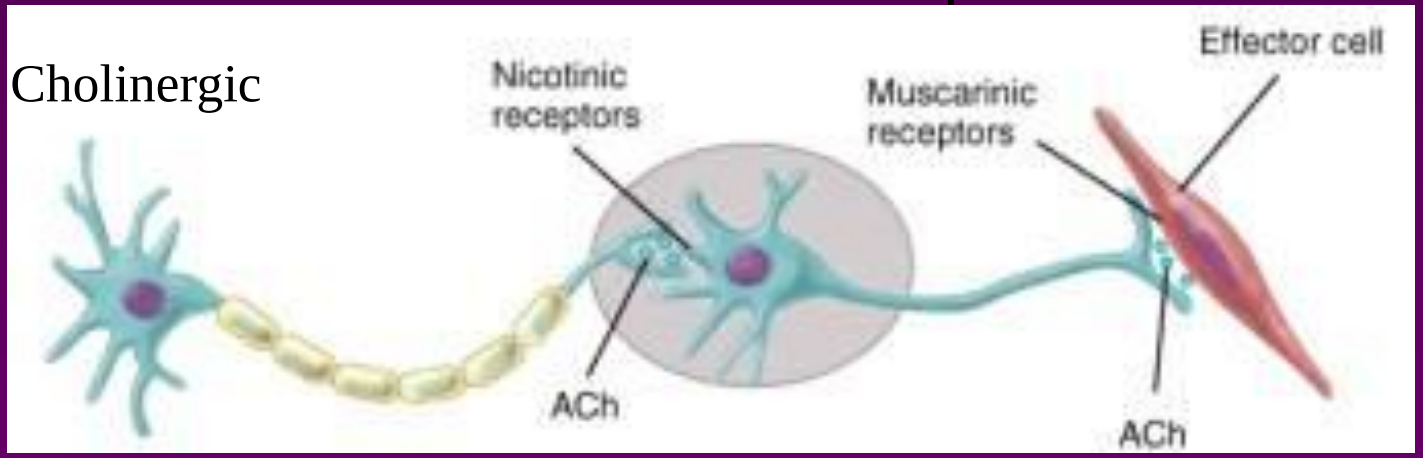
- The parasympathetic nervous system uses only acetylcholine (ACh) as its neurotransmitter.
- The ACh acts on two types of receptors, the muscarinic and nicotonic choloinergic receptors.
- Most transmissions occur in two stages: When stimulated, the preganglionic nerve releases ACh at the ganglion, which acts on nicotinic receptors of the postganglionic nerve.
- The postganglionic nerve then releases ACh to stimulate the muscarinic receptors of the target organ.
- The Sympathetic NS Acts on tow types of receptors : α and β.

ANS Receptors : Classified as either parasympathetic or sympathetic

Adrenergic



Cholinergic



What do the receptors do?

Activation of **α receptors** leads to smooth muscle contraction

Activation of **β_2 receptors** leads to smooth muscle relaxation

Activation of **β_1 receptors** leads to smooth muscle contraction (especially in heart)

THANK YOU
