

ARM, CUBITAL FOSSA & ELBOW JOINT

Drs. Sanaa Alshaarawy & Khaleel Alyahya

Visuals Unlimited

OBJECTIVES

- ❖ At the end of the lecture, students should:
 - Describe the attachments, actions and innervations of:
 - ✓ Biceps brachii
 - ✓ Coracobrachialis
 - ✓ Brachialis
 - ✓ Triceps brachii
 - Demonstrate the following features of the elbow joint:
 - ✓ Articulating bones
 - ✓ Capsule
 - ✓ Lateral & medial collateral ligaments
 - ✓ Synovial membrane
 - Demonstrate the **movements** : **flexion** and **extension** of the elbow.
 - List the **main muscles** producing the above movements.
 - Define the **boundaries of the cubital fossa** and enumerate **its contents**.

The ARM

Shoulder

Elbow

Arm

Posterior view

Anterior view

Humerus

The ARM

❖ The lateral and medial **intermuscular septa** divide the distal part of the arm into two compartments:

- Anterior
- Posterior

Anterior Fascial Compartment Contents

- **Muscles:** Biceps brachii, Coracobrachialis & Brachialis.
- **Blood Vessels:** Brachial artery & Basilic vein.
- **Nerves:** Musculocutaneous, Median, Radial & Ulnar.

Muscles of the Anterior Compartment

Biceps brachii →

Coracobrachialis →

Brachialis →

Biceps Brachii

❖ **Origin:** Two heads:

➤ **Long Head (lateral head)** from supraglenoid tubercle of scapula (intracapsular)

➤ **Short Head** from the tip of coracoid process of scapula.

❖ The two heads join in the middle of the arm

Biceps Brachii

❖ Insertion:

- into the posterior part of the **radial tuberosity**.
- into the **deep fascia of the medial aspect of forearm through bicipital aponeurosis**.

❖ Nerve supply:

- **Musculocutaneous**

❖ Action:

- **Strong supinator** of the forearm
 - ✓ used in screwing.
- **Powerful flexor** of elbow
- **Weak flexor** of shoulder

Coracobrachialis

❖ Origin:

➤ Tip of the **coracoid process of scapula** (with short head of biceps brachii).

❖ Insertion:

➤ **Middle** of the medial side of the **shaft of the humerus**

❖ Nerve supply:

➤ **Musculocutaneous**

❖ Action:

➤ **Flexor** & a weak adductor of the **arm**

Brachialis

❖ Origin:

- Front of the **lower half** of humerus

❖ Insertion:

- Anterior surface of **coronoid process of ulna**

❖ Nerve supply:

- **Musculocutaneous & Radial**

❖ Action:

- **Strong flexor** of the forearm

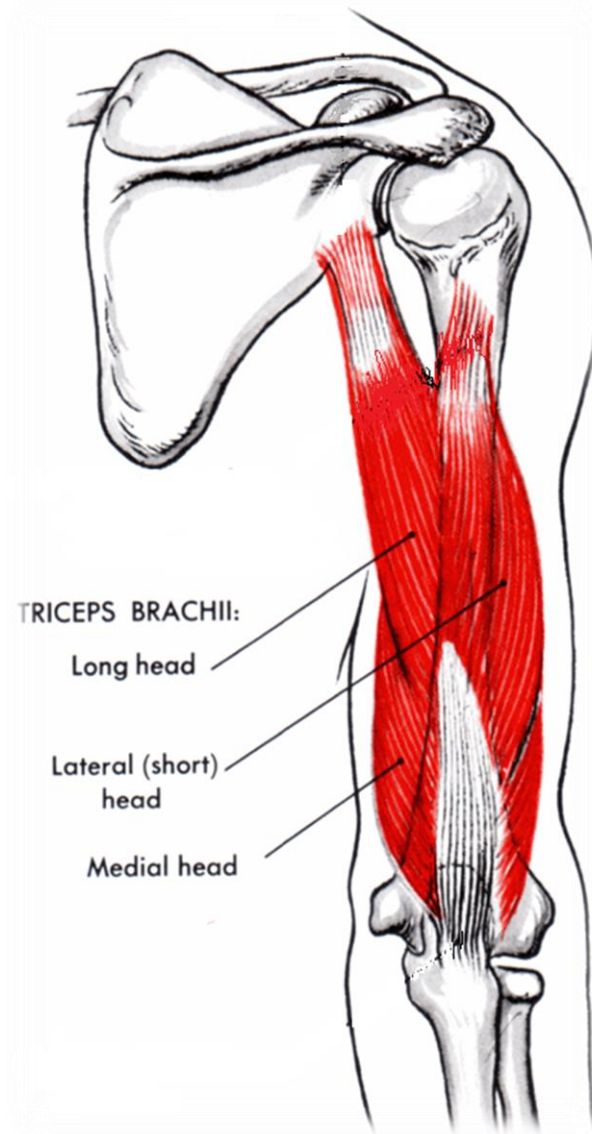

Posterior Fascial Compartment Contents

- **Muscles:** Triceps
- **Vessels:** Profunda brachii & Ulnar collateral arteries
- **Nerves:** Radial & Ulnar

Muscles of the Posterior Compartment

Triceps brachii

Triceps

Origin: Three heads:

- **Long Head** from **infraglenoid tubercle** of the scapula
- **Lateral Head** from the upper half of the **posterior surface** of the shaft of **humerus above** the **spiral groove**
- **Medial Head** from the lower half of the **posterior surface** of the shaft of **humerus below** the **spiral groove**

Triceps

❖ Insertion:

➤ **Common tendon** inserted into the upper surface of the **olecranon process of ulna**

❖ Nerve supply:

➤ **Radial nerve**

❖ Action:

➤ **Strong extensor** of the **elbow joint**

Cubital Fossa

is a **triangular depression** that **lies in front of the elbow**

Boundaries of Cubital Fossa

❖ Base:

- Line drawn through the two epicondyles of humerus

❖ Laterally:

- Brachioradialis

❖ Medially:

- Pronator teres

❖ Roof:

- Skin, superficial & deep fascia and bicipital aponeurosis

❖ Floor:

- **Brachialis** medially and **supinator** laterally.

Contents of Cubital Fossa

(From medial to lateral side)

3. Biceps brachii tendon

4. Deep branch of radial nerve

1. Median nerve

2. Brachial artery divides into radial & ulnar arteries.

Ulnar artery

Radial artery

ELBOW Joint

Uniaxial, Synovial Hinge joint

Articulation

- Trochlea and capitulum of the **humerus** above
- Trochlear notch of **ulna** and the head of **radius** below

❖ The articular surfaces are covered with **articular (hyaline) cartilage**.

Capsule

Anteriorly: attached

➤ Above

✓ To the **humerus** along the **upper margins** of the **coronoid** and **radial fossa** and to the **front** of the **medial** and **lateral epicondyles**.

➤ Below

✓ To the **margin** of the **coronoid process** of the **ulna** and to the **anular ligament**, which surrounds the **head** of the **radius**.

Capsule

Posteriorly: attached

➤ Above

✓ To the margins of the olecranon fossa of the humerus.

➤ Below

✓ To the upper margin and sides of the olecranon process of the ulna and to the anular ligament.

Ligaments

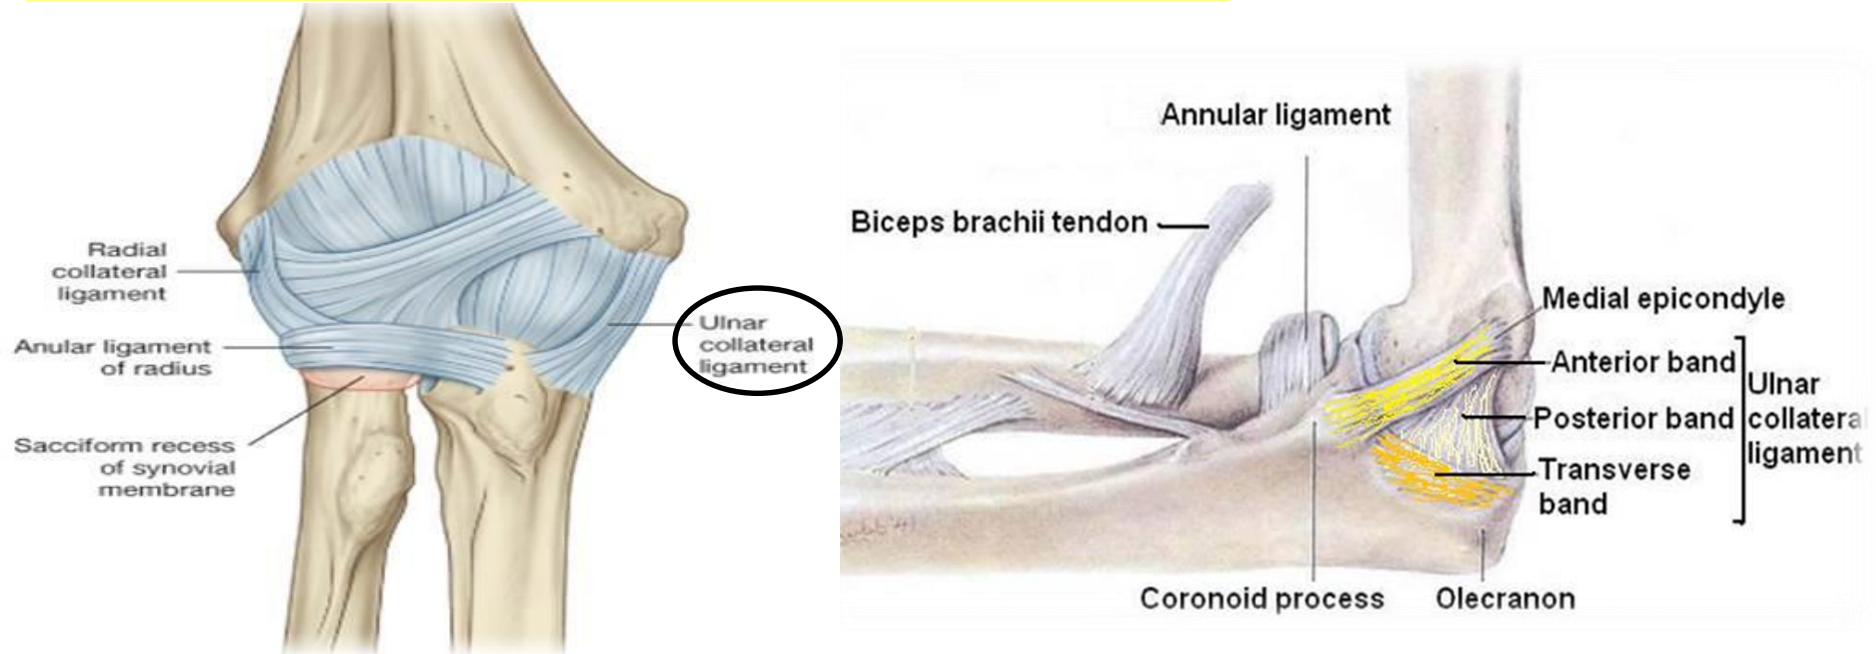

Lateral (radial collateral) ligament

- ❖ Triangular in shape:
- ❖ Apex
 - Attached to the **lateral epicondyle of humerus**
- ❖ Base
 - Attached to the upper margin of **annular ligament**.

Ligaments

Medial (ulnar collateral) ligament

❖ Anterior strong cord-like band:

- Between **medial epicondyle** and the **coronoid process** of ulna

❖ Posterior weaker fan-like band:

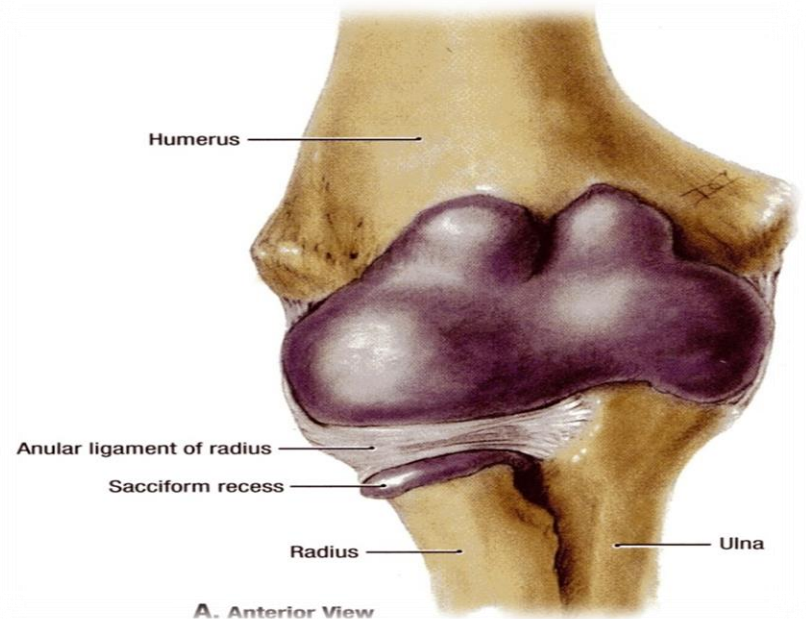

- Between **medial epicondyle** and the **olecranon process** of ulna

❖ Transverse band:

- Passes **between** the **anterior** and **posterior** bands

Synovial Membrane

- ❖ This lines the inner surface of the capsule and covers fatty pads in the floors of the coronoid, radial, and olecranon fossa.
- ❖ Is continuous below with synovial membrane of the superior radioulnar joint

Relations

❖ Anterior:

- Brachialis, tendon of biceps, **median nerve**, **brachial artery**

❖ Posterior:

- Triceps muscle, small bursa intervening

❖ Lateral:

- Common extensor tendon & the supinator

❖ Medial:

- Ulnar nerve
 - Considered the largest unprotected nerve by muscle or bone.

Anatomy of the Elbow

Bursae around the elbow joint:

- Subcutaneous olecranon bursa
- Subtendinous olecranon bursa

Movements

❖ Flexion

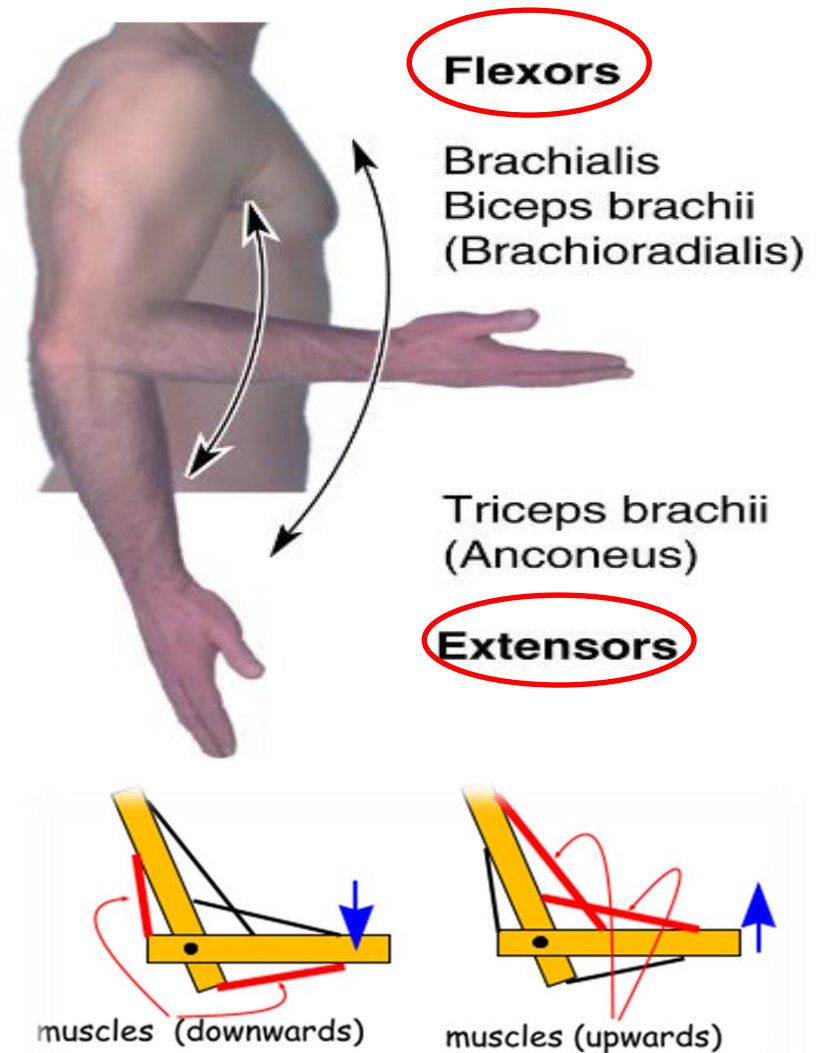

- Is limited by the anterior surfaces of the forearm and arm coming into contact.

❖ Extension

- Is limited by the tension of the anterior ligament and the brachialis muscle.

❖ The joint is supplied by branches from the:

- Median
- Ulnar
- Musculocutaneous
- Radial nerves

Carrying Angle

❖ Angle

➤ **Between** the **long axis** of the **extended forearm** and the **long axis** of the **arm**

❖ Opens

➤ Laterally

❖ About

➤ 170 degrees in **male** and 167 degrees in **females**

❖ Disappears

➤ When the **elbow joint** is **flexed**

❖ Permits

➤ The forearms to clear the hips in **swinging movements** during **walking**, and is important when **carrying objects**

Articulations and applied anatomy

- ❖ The elbow joint is **stable** because of the:
 - Wrench-shaped articular surface of the olecranon and the pulley-shaped trochlea of humerus
 - Strong medial and lateral ligaments.
- ❖ Elbow dislocations are common & most are posterior.
 - Posterior dislocation usually follows falling on the outstretched hand.
 - Posterior dislocations of the joint are common in children because the parts of the bones that stabilize the joint are incompletely developed.

Elbow Dislocation

ELBOW Joint

❖ **Avulsion of the epiphysis** of the **medial epicondyle** is also **common in childhood** because the **medial ligament** is **much stronger** than the **bond of union** between the **epiphysis** and the **diaphysis**.

❖ They are usually a **result from** an **avulsion (pull off) injury** caused by a **valgus stress** at the **elbow** and **contraction** of the **flexor** muscles as in :

- ✓ fall on an outstretched hand with the elbow in full extension
- ✓ posterior elbow dislocation
- ✓ direct blow

THANK YOU
