# PECTORAL REGION AND AXILLA

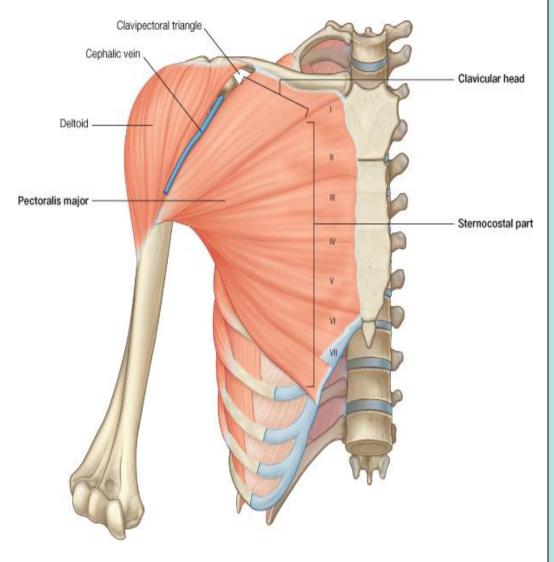

- *By:*
- Prof.Saeed Abulmakarem.
- DR.Snaa AL-Shaarawy.

# **OBJECTIVES**

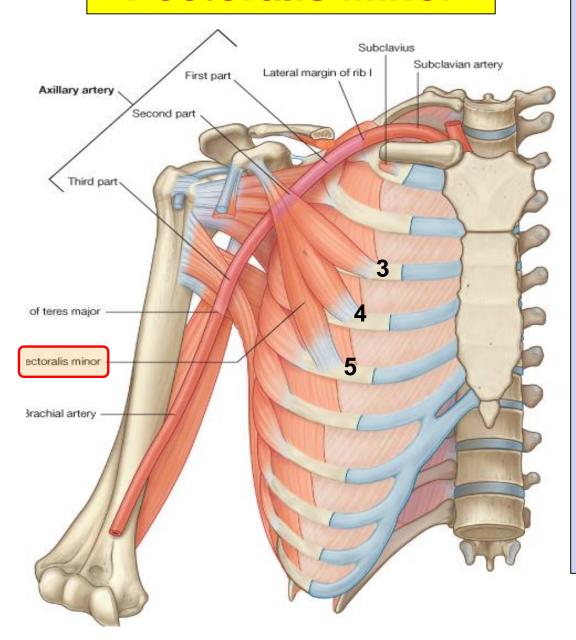

- By the end of the lecture the students should be able to:
- Identify and describe the <u>muscles of the pectoral</u> region.
- Pectoralis major.
- Pectoralis minor.
- Subclavius.
- Serratus anterior.
- Describe and demonstrate the <u>boundaries</u> and <u>contents</u> of the <u>axilla</u>.
- Describe the <u>formation</u> of the <u>brachial plexus</u> and its <u>branches.</u>

## **Pectoralis Major**

- Origin: 2 heads;
- Clavicular head: From;
- Medial ½ of the front of the clavicle.
- Sternocostal head: From;
- Sternum.
- Upper 6 costal cartilages.
- Aponeurosis of the external oblique muscle.
- Insertion :
- Lateral lip of bicipital groove.
- Nerve supply:
- Medial & lateral pectoral nerves.
- Action:
- Adduction and medial rotation of the arm.
- Clavicular head helps in flexion of arm (shoulder).

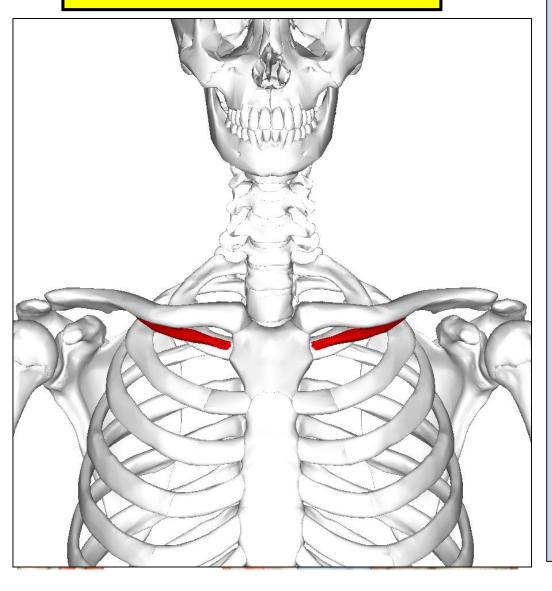

## **Pectoralis Minor**

### Origin:

- From 3<sup>rd</sup> ,4<sup>th</sup>, & 5<sup>th</sup> ribs close to their costal cartilages.
- Insertion:
- Coracoid process.
- Nerve supply:
- Medial pectoral nerve.
- Action:
- Depression of the shoulder.
- Draw the ribs upward and outwards during deep inspiration.

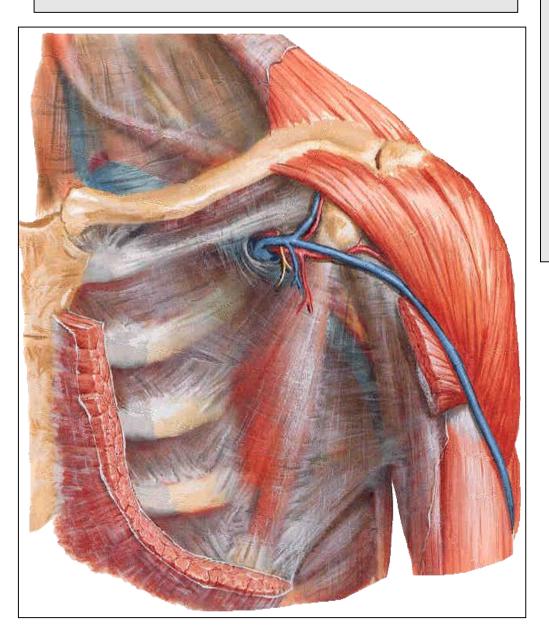

## **Subclavius**

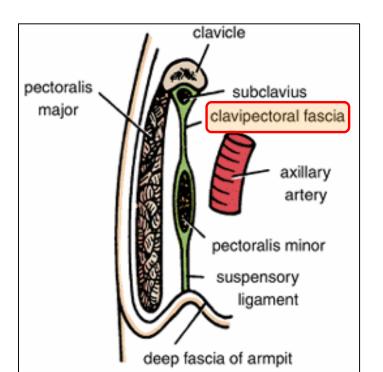

#### Origin:

- From 1<sup>st</sup> rib at its costal cartilage.
- Insertion:
- Subclavian groove in the middle 1/3 of the inferior surface of clavicle.
- Nerve supply:
- Nerve to subclavius from <u>upper trunk</u> of brachial plexus.
- Action:
- Fixes the clavicle during movement of shoulder joint.

## Clavipectoral Fascia

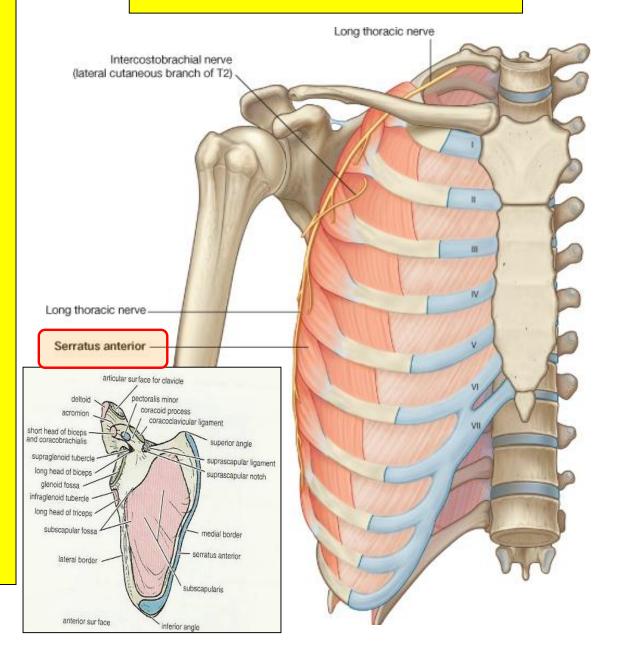

- It is a thickened membrane of deep fascia between the <u>subclavius</u> and <u>pectoralis minor</u>.
- It is pierced by :
- Lateral pectoral nerve.
- Thoraco- acromial artery
- Cephalic vein.
- Few lymph vessels.

#### **Origin:**

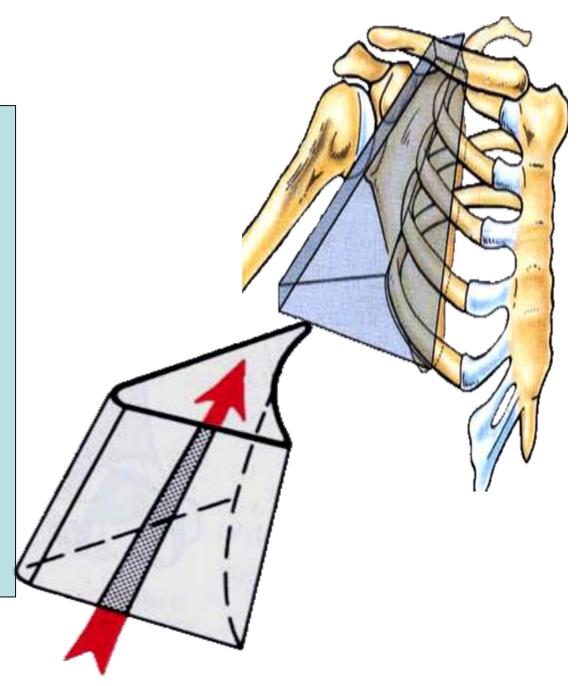

- Upper eight ribs.
- Insertion:
- anterior aspect of the <u>medial border</u> and <u>inferior angle</u> of <u>scapula.</u>
- Nerve supply:
- Long thoracic nerve (from roots of brachial plexus, C5,6,7).
- Action:
- Draws the scapula forward in boxing, (protrusion or protraction). "boxer's muscle"
- Rotates scapula outwards in raising the arm above 90 degree.

### **Serratus anterior**

## **AXILLA**

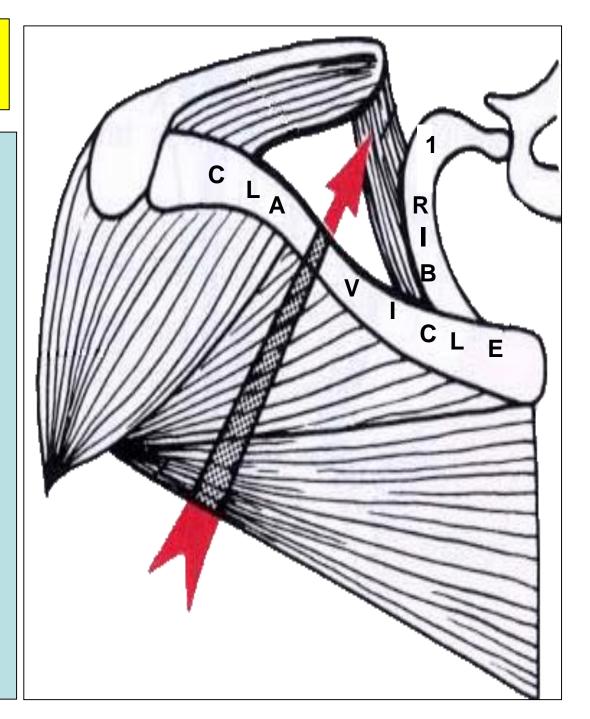

- A pyramid-shaped space between the upper part of the arm and the side of the chest through which major neurovascular structures pass between neck & thorax and upper limbs.
- Axilla has an apex, a base and four walls.

# Boundaries of the Axilla

## Apex:

- Is directed upwards & medially to the root of the neck.
- It is called
  - Cervicoaxillary canal.
- It is bounded, by 3 bones:
  - Clavicle anteriorly.
  - Upper border of the scapula posteriorly.
  - Outer border of the first rib medially.

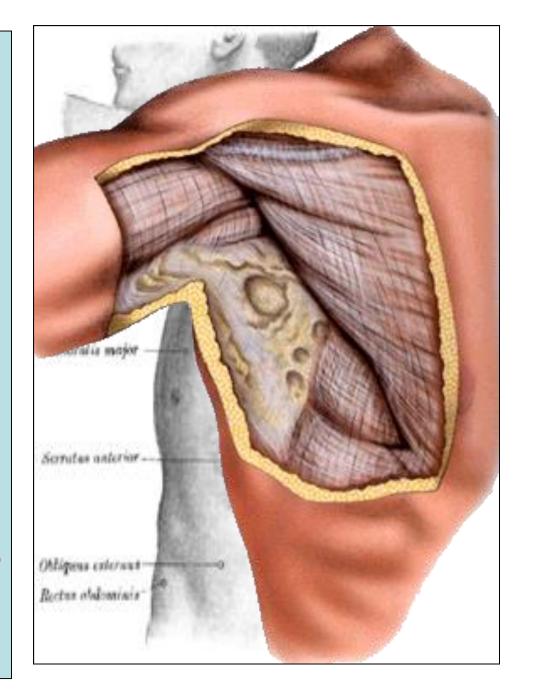

## Base:

 Formed by skin stretching between the anterior and posterior walls.

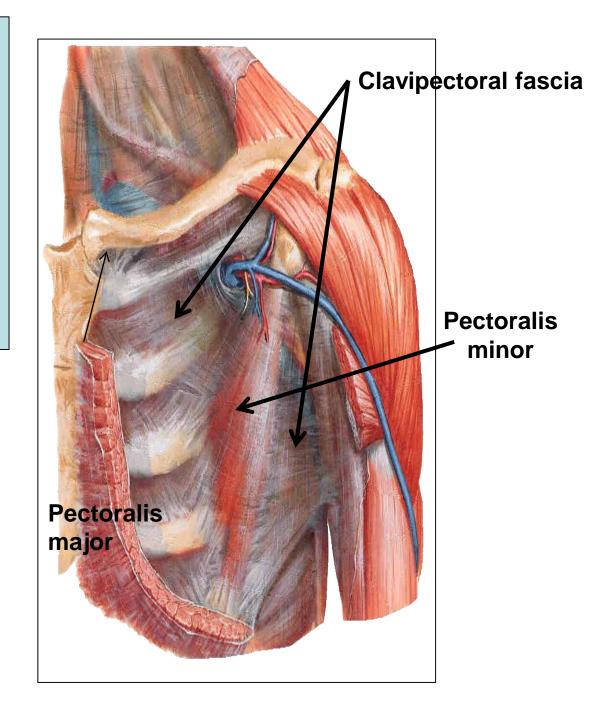

#### is bounded:

- In front by the anterior axillary fold (formed by the lower border of Pectoralis major).
- Behind by the posterior axillary fold (formed by tendons of latissimus dorsi and teres major).
- Medially by upper 4 to 5 ribs & the chest wall.

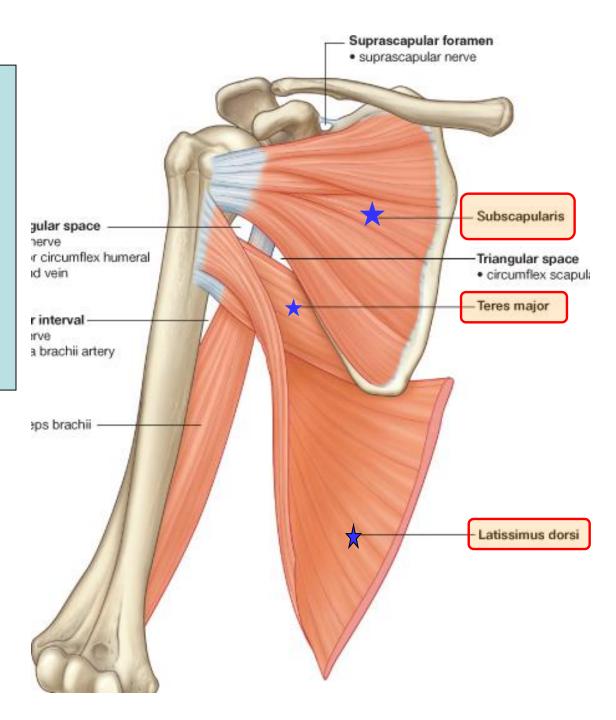

## • Anterior wall:

- Is formed by :
  - Pectoralis major
  - Pectoralis minor
  - Subclavius
  - Clavipectoral fascia:

### Posterior wall:

- Is <u>formed by:</u>
  - Subscapularis.
  - Latissimus dorsi.
  - Teres major muscles.

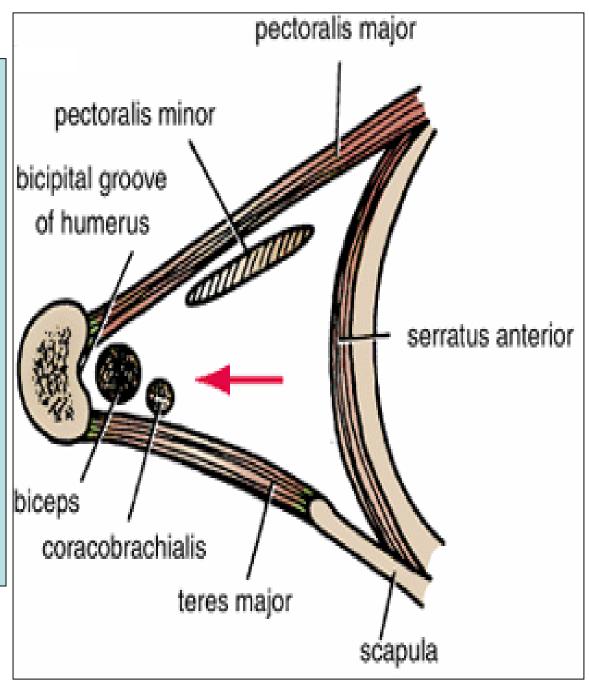

## The medial wall:

- It is wide and <u>formed by:</u>
  - Serratus anterior.
  - Upper 4-5 ribs & Intercostal muscles.

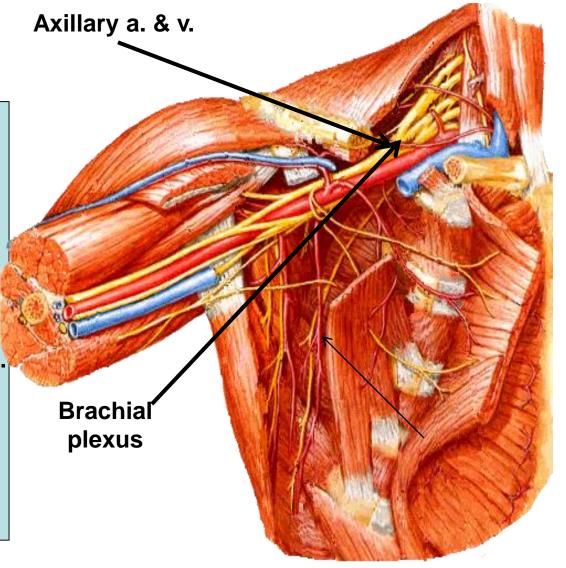

### The lateral wall:

- It is narrow and <u>formed</u> <u>by:</u>
  - Coracobrachi-alis.
  - Biceps brachii.
  - Bicepital groove of the humerus.

# Contents of The Axilla

- Cords and braches of the brachial plexus
- Axillary artery and its branches.
- Axillary vein and its tributaries.
- Axillary lymph nodes.
- Axillary fat.
- <u>Loose</u> connective tissue.

The neurovascular bundle is enclosed in connective tissue sheath, called 'axillary sheath'

## What is a Brachial Plexus?

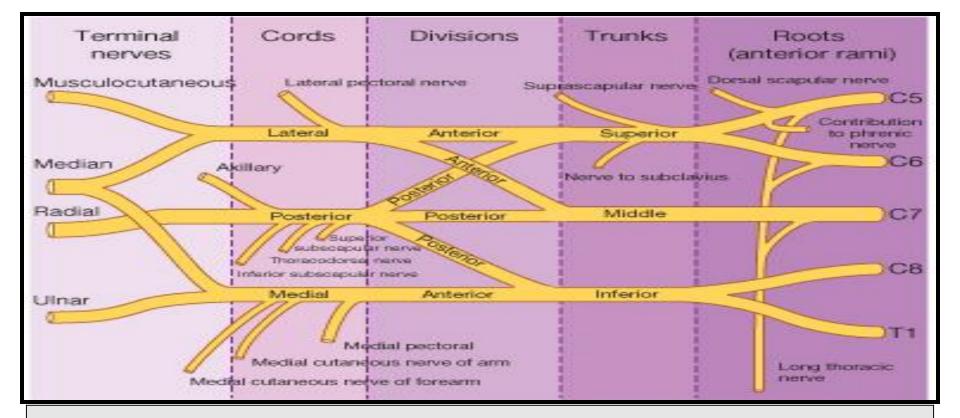

Brachial Plexus is a <u>network of nerves that</u> is formed at the <u>root of the neck</u> to enter the upper limb.

#### **Location & Formation**

Brachial Plexus is present in the posterior triangle of the neck & axilla.

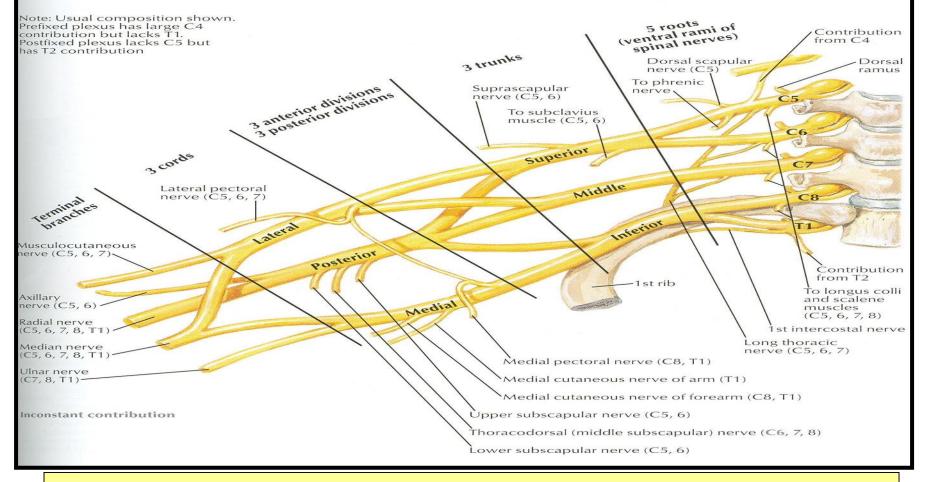

It is formed by the union of the anterior Rami of the C 5<sup>th</sup>, 6<sup>th</sup>, 7<sup>th</sup> & 8<sup>th</sup> and the 1<sup>st</sup> thoracic spinal nerve.

Roots of C5 & C6 unite to form---- Upper trunk Root of C7 continuous as the----- Middle trunk Roots of C8 & T1 unite to form---- Lower trunk

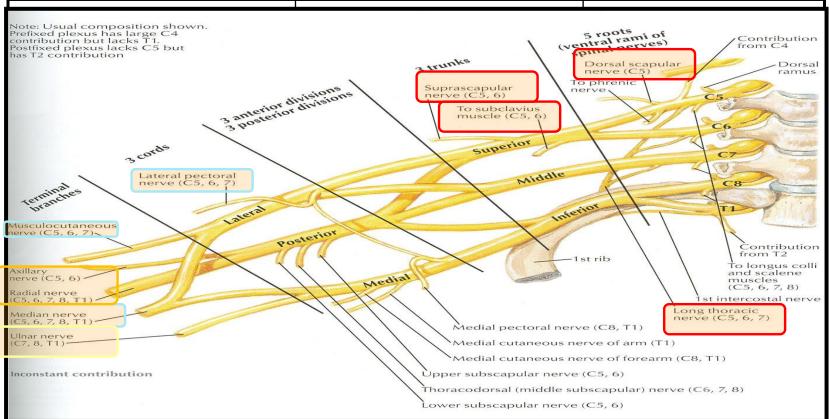

#### The Plexus can be divided into 5 stages:

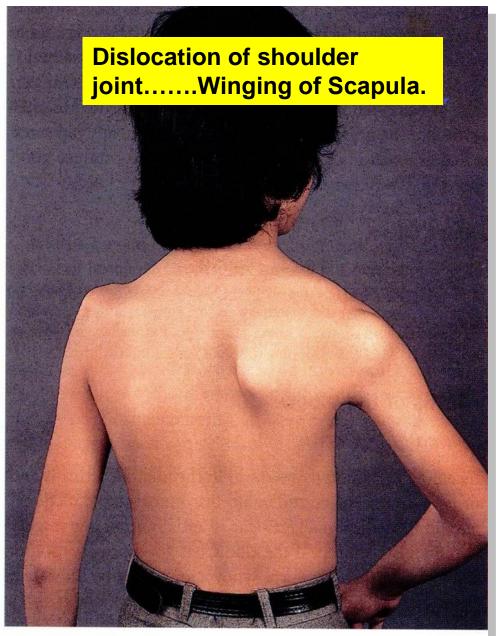

- **❖Roots:** in the posterior∆
- **❖Trunks**: in the posterior∆
- Divisions: behind the clavicle (in cervico-axillary canal)
- Cords: in the axilla
- **Branches**: in the axilla
- The first 2 stages lie in the posterior triangle, while the last 2 sages lie in the axilla. 16

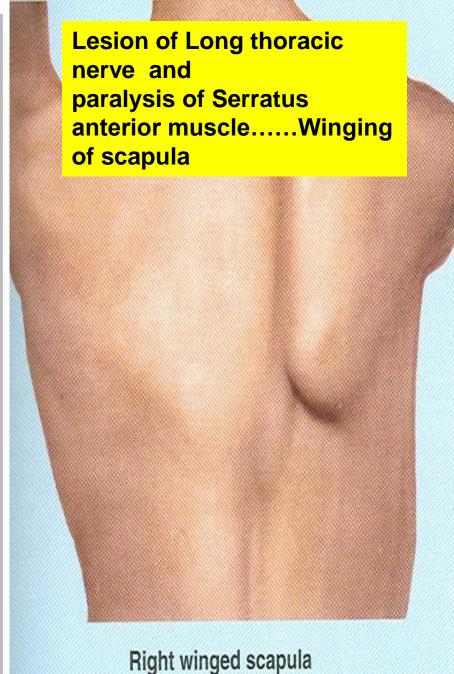

- The anterior divisions of the upper and middle trunks unite to form the Lateral cord.
- The anterior division of the lower trunk continues as the Medial cord.
- All the <u>posterior divisions</u> of three trunks join to form the Posterior cord.

Lateral cord-3	Medial cord-5	Posterior cord-5
Lateral pectoral nerve.	Medial pectoral nerve.	Axillary nerve.
Musculocutaneous nerve.	Ulnar nerve.	Radial nerve.
Median nerve (lateral root).	Median nerve (medial root).	Upper & lower subscapular nerves.
	Medial cutaneous nerve of arm & forearm.	Thoracodorsal or N. to latissimus dorsi.

**Fig. 22.15** Multidirectional voluntary dislocation of the shoulder. This 9-year-old boy can voluntarily dislocate his shoulder posteriorly.

# THANK YOU

## SUMMARY

- Muscles of the pectoral region are connecting the upper limb with anterior and lateral thoracic wall:
- Pectoralis major.
- Pectoralis minor.
- Subclavius.
- Serratus anterior.
- ■The axilla is a pyramidal space situated between the upper part of arm and the side of the chest, it has 4 walls (anterior, posterior, medial and lateral), base, and apex.
- ■The axilla is an important space as it transmits the neurovascular bundle from the neck and thorax to the upper limb.

#### It contains:

- Axillary vessels.
- Cords and branches of the brachial plexus.
- •Axillary lymph nodes.
