

Glycogen Metabolism

By

Dr. Amr S. Moustafa, MD, PhD

**Clinical Chemistry Unit
Department of Pathology
College of Medicine, King Saud University**

Objectives:

- **Storage of carbohydrates in liver & muscle**
- **Carbohydrates storage as glycogen**
- **Overview of glycogen synthesis (Glycogenesis)**
- **Overview of glycogen breakdown (Glycogenolysis)**
- **Key elements in regulation of both Glycogenesis and Glycogenolysis**

Location & Functions of Glycogen

- **Location of glycogen in the body**

skeletal muscle & liver

400 g in **muscles** (1-2% of resting muscles weight)

100 g in **liver** (~ 10% of well-fed liver)

- **Functions of glycogen:**

Function of muscle glycogen: fuel reserve (ATP)
(during muscular exercise)

Function of liver glycogen: a source for blood glucose
(especially during early stages of fasting)

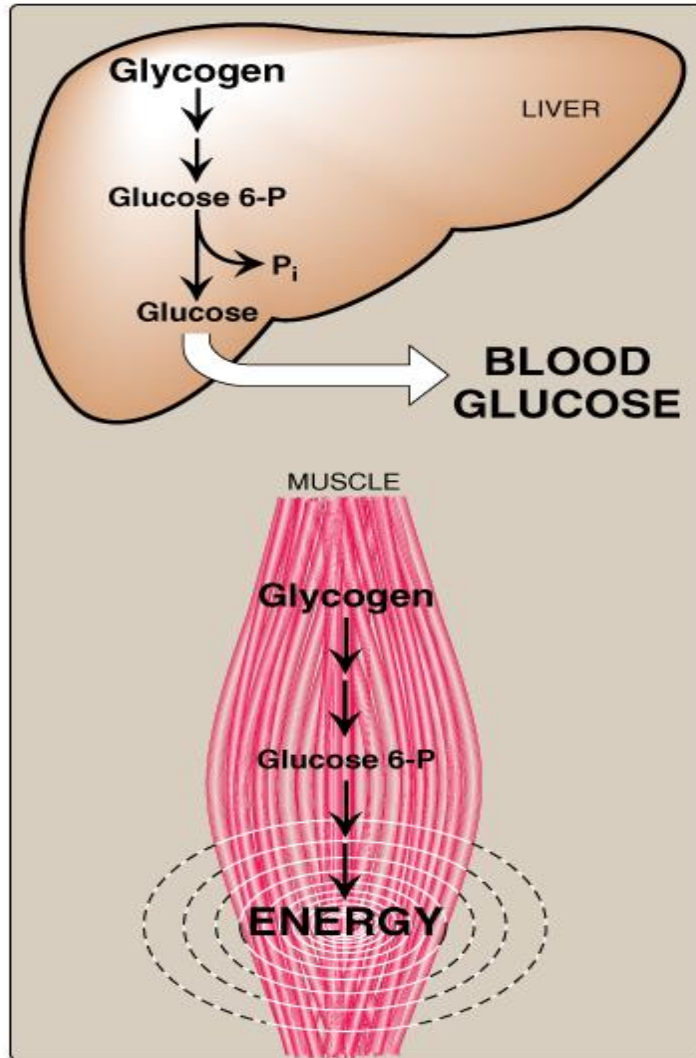

Figure 11.2
Functions of muscle and liver glycogen.

Structure of Glycogen

- Glycogen is a branched-chain homopolysaccharide made exclusively from α -D-glucose
- Glucose residues are bound by $\alpha(1 - 4)$ glucosidic linkage
- Branches (every 8-10 residue) are linked by $\alpha(1-6)$ glucosidic linkage
- Glycogen is present in the cytoplasm in the form of granules which contain most of the enzymes necessary for glycogen synthesis & degradation

Structure of Glycogen

Metabolism of Glycogen in Skeletal Muscle

Glycogenesis:

Synthesis of Glycogen from Glucose

Glycogenolysis:

Breakdown of Glycogen to Glucose-6-phosphate

GLYCOGENESIS

(*Synthesis of Glycogen in Skeletal Muscles*)

1- Building blocks: **UDP-GLUCOSE**

2- Initiation of synthesis:

Elongation of pre-existing glycogen fragment

OR

The use of **glycogen primer (glycogenin)**

3- **ELONGATION:** **Glycogen synthase** (for α 1-4 linkages)

Glycogen synthase cannot initiate synthesis but only elongates pre-existing glycogen fragment or glycogen primer (glycogenin)

4- **BRANCHING:** **Branching enzyme** (for α 1-6 linkages)

Synthesis of Glycogen

Glycogenolysis

(Breakdown of glycogen in skeletal muscles)

1- Shortening of glycogen chain: by glycogen phosphorylase

Cleaving of $\alpha(1-4)$ bonds of the glycogen chain producing glucose 1-phosphate

Glucose 1-phosphate is converted to **glucose 6-phosphate** (by mutase enzyme)

2- Removal of branches : by debranching enzymes

Cleaving of $\alpha(1-6)$ bonds of the glycogen chain producing **free glucose (few)**

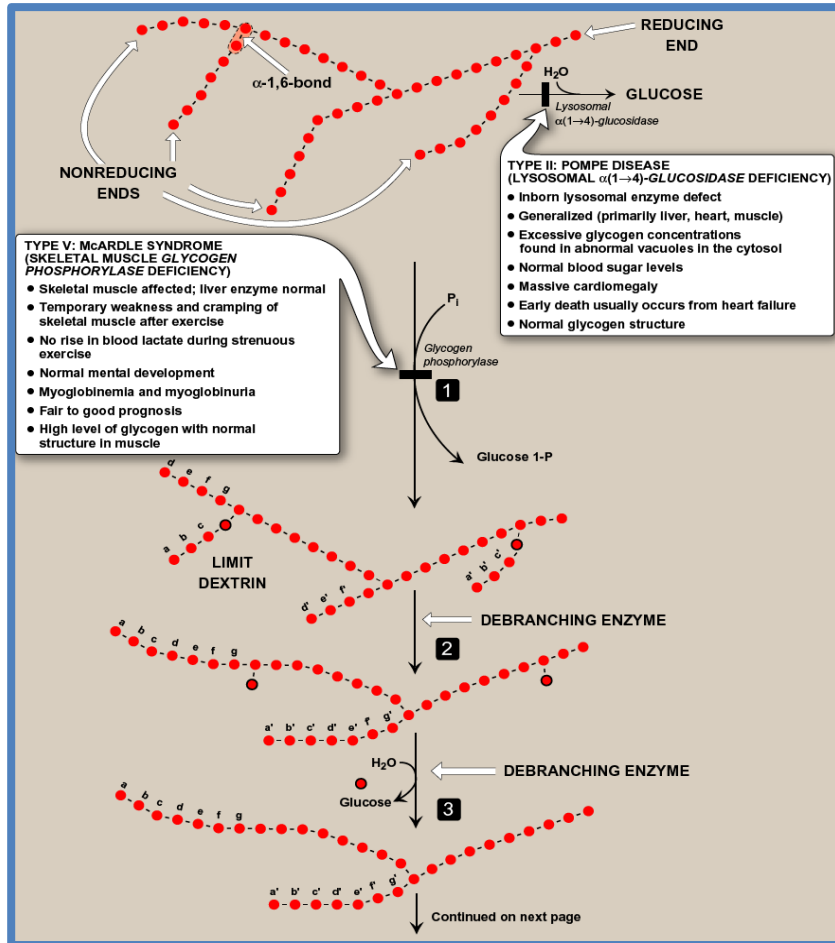

3- Fate of glucose 6-phosphate (G-6-P):

- G-6-P is ***not*** converted to free glucose
- It is used as a source of energy for skeletal muscles during muscular exercise (by anaerobic glycolysis starting from G-6-P step)

Glycogenolysis

Glycogenolysis

Regulation of Glycogen Metabolism

Synthesis & degradation of glycogen are tightly regulated

In Skeletal Muscles:

- Glycogen **degradation** occurs during **active exercise**
- Glycogen **synthesis** begins when the **muscle is at rest**
- Regulation occurs by 2 mechanisms:
 - 1- Allosteric regulation**
 - 2- Hormonal regulation
(Covalent modification)**

Regulation of Glycogen Metabolism

1. Allosteric Regulation

Regulation of Glycogen Metabolism

Increase of calcium during muscle contraction

Formation of Ca^{2+} -calmodulin complex

Activation of Ca^{2+} -dependent enzymes,
e.g., glycogen phosphorylase

Regulation of Glycogen Metabolism:

2. Hormonal Regulation by Epinephrine

Muscle contraction

Epinephrine release

Skeletal muscle: Epinephrin/receptor binding

Second messenger: cAMP

Response: Enzyme phosphorylation

Glycogen synthase
(Inactive form)

Glycogen phosphorylase
(Active form)

Inhibition of glycogenesis

Stimulation of glycogenolysis

Glycogen Storage Diseases

A group of genetic diseases that result from a defect in an enzyme required for glycogen synthesis or degradation

They result in:

Formation of abnormal glycogen structure

OR

Excessive accumulation of normal glycogen in a specific tissue

Glycogen Storage Diseases

GSD Type V (Mc Ardle Syndrome)

- Deficiency of skeletal muscle glycogen phosphorylase
