Cystitis

Renal Block

PROF. HANAN HABIB

Department of Pathology and Laboratory Medicine-Microbiology unit-KSUMC

Objectives

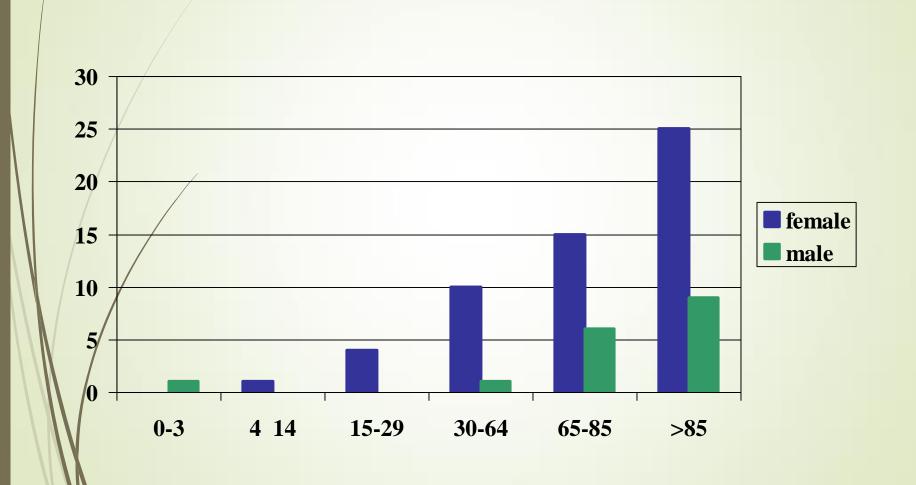

- 1-To define the term cystitis and who is commonly get cystitis.
- 2- To describe the pathogenesis and risk factors of cystitis.
- 3- To know the most common causative organisms of cystitis
- 4- To recognize different types of cystitis (infectious and non-infectious).
- 5- To recognize that venereal diseases can present with cystitis.
- 6- To understand the laboratory diagnostic of cystitis
- 7-To know the antimicrobial agents suitable for the treatment and prevention of cystitis.

Introduction

- Urinary Tract infection (UTI) divided into upper and lower urinary tract infections
- Patient presents with urinary symptoms and significant bacteriuria = 10⁵ bacteria/ml
- Asymptomatic bacteriuria when the patient presents with significant bacteria in urine but without symptoms

Prevalence of Bacteriuria in different age groups

Lower UTIs

<u>Cystitis</u> (infection of the bladder; superficial mucosal infections)

Urethritis (sexually transmitted pathogens)

- urethritis in men & women

Prostatitis and **Epididymitis**

Upper UTIs Acute pyelonephritis

Chronic pyelonephritis

Uncomplicated UTI (empirical therapy is possible)

Complicated UTI (nosocomial UTI, relapses, structural or functional abnormalities)

Cystitis

- In women: cystitis is common due to a number of reasons:
 - Short urethra
 - Pregnancy
 - Decreased estrogen production during menopause.
- In men: mainly due to persistent bacterial infection of the prostate.
- In both sexes: common risk factors are:
 - Presence of bladder stone
 - Urethral stricture
 - Catheterization of the urinary tract
 - Diabetes mellitus

Pathogenesis of cystitis

- Due to frequent irritation of the mucosal surfaces of the urethra and the bladder.
- Infection results when bacteria ascends to the urinary bladder. These bacteria are residents or transient members of the perineal flora, and are derived from the large intestine flora.
- Toxins produced by uropathogens.
- Conditions that create access to bladder are:
 - Sexual intercourse due to short urethral distance.

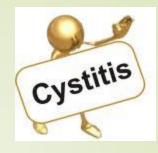

Pathogenesis of cystitis

 -Uncomplicated UTI usually occurs in non pregnant, young sexually In sexually active female without any structural or neurological abnormality

-Risk factors:

- Catheterization of the urinary bladder, instrumentation
- Structural abnormalities
- Obstruction
- -Haematogenous through blood stream (less common) from other sites of infection

Etiologic agents

- E.coli is the most common (90%) cause of cystitis. Other Enterobacteria include (Klebsiella pnumoniae, Proteus spp.) Other gram negative rods eg. P.aeroginosa.
- Gram positive bacteria :Enterococcus faecalis, group B Streptococcus and Staphylococcus saprophyticus { honeymoon cystitis}.
- Candida species
- Venereal diseases (gonorrhea, Chlamydia) may present with cystitis.
- Schistosoma hematobium in endemic areas.

Pathogens involved

Uncomplicated UTI

E. coli 64% Enterobacteriaceae 16% Enterococcus spp 20% Pseudomona spp <1% S. aureus <1%

Special cases

(S. epidermidis) S. saprophyticus Yeasts (catheter related result) Viruses (Adeno, Varicella) Chlamydia trachomatis

Complicated UTI

E. coli Enterobacteriaceae (% is not

Pseudomonas spp

possibl Acinetobacter spp e to

judge, often multi-resistant strains)

Clinical presentation

Symptoms usually of acute onset.

- Dysuria (painful urination)
- Frequency (frequent voiding)
- Urgency (an imperative call for toilet)
- Hematuria (blood in urine) in 50% of cases.
- Usually no fever.

Cystitis (80%)
E. coli,
S. saprophyticus
Proteus spp.
Klebsjella spp.

Urethritis (10-15%)

C. trachomatis,
N. gonorrhoeae
H. simplex
Other bacteria?

Non-infectious (<1%)

Hypoestrogenism
Functional obstruction
Mechanical obstruction
Chemical S

How to differentiate between cystitis and urethritis?

- Cystitis is of more acute onset
- More sever symptoms
- Pain, tenderness on the supra-pubic area.
- Presence of bacteria in urine (bacteriuria)
- Urine cloudy, malodorous and may be bloody

- Non-infectious cystitis such as:
- 1. Traumatic cystitis in women
- Interstitial cystitis (unknown cause, may be due to autoimmune attack of the bladder)
- 3. Eosinophilic cystitis due to S.hematobium
- 4. Hemorrahagic cystitis due to radiotherapy or chemotherapy.

Laboratory diagnosis of cystitis

- 1. Specimen collection:
- Most important is clean catch urine [Midstream urine (MSU)] to bypass contamination by preneal flora and must be before starting antibiotic.
- Supra-pubic aspiration or catheterization may be used in children.
- Catheter urine should not be used for diagnosis of UTI.

2- Microscopic examination:

- About 90% of patients have > 10 WBCs /cu.mm
- Gram stain of uncentrifuged sample is sensitive and specific.
- One organism per oil-immersion field is indicative of infection.
- Blood cells, parasites or crystals can be seen

3- Chemical screening tests:

- Urine dip stick –rapid ,detects nitrites released by bacterial metabolism and leukocyte esterase from inflammatory cells. Not specific.
- 4- **Urine culture**: important to identify bacterial cause and antimicrobial sensitivity.
- Quantitative culture typical of UTI (>100,000 /cumm) Lower count (<100,000 or less eg. 1000/cumm) is indicative of cystitis if the patient is symptomatic.

Urinalysis (sample collected after fluid therapy)

Bacteria Negative

Epithelial cells 0-3

Recurrent cystitis

- Three or more episodes of cystitis /year
- Requires further investigations such as Intra-Venous Urogram (IVU) or Ultrasound to detect obstruction or congenital deformity.
- Cystoscopy required in some cases.

Treatment of cystitis

- Empiric treatment commonly used depending on the knowledge of common organism and sensitivity pattern.
- Treatment best guided by susceptibility pattern of the causative bacteria.
- Common agents: Ampicillin, Cephradine,
 Ciprofloxacin, Norfloxacin, Gentamicin or TRM-SMX.

- Duration of treatment: three days for uncomplicated cystitis
- 10-14 days for complicated and recurrent cystitis.
- Prophylaxis required for recurrent cases by Nitrofurantoin or TRM-SMX.
- Prevention: drinking plenty of water and prophylactic antibiotic.
