

DIURETICS

Prof. Hanan Hagar
Pharmacology Unit

Thiazide diuretics

Drugs as:

- **Chlorothiazide**
- **Hydrochlorothiazide**
- **Chlorthalidone**
- **Metolazone**
- **Indapamide**

THIAZIDE DIURETICS

Chlorothiazide
Potency 0.1, $t_{1/2}$ 2h

Chlorthalidone
Potency 10, $t_{1/2}$ 26h

Metolazone
Potency 5, $t_{1/2}$ 5h

Hydrochlorothiazide
Potency 1, $t_{1/2}$ 3h

Indapamide
Potency 20, $t_{1/2}$ 16h

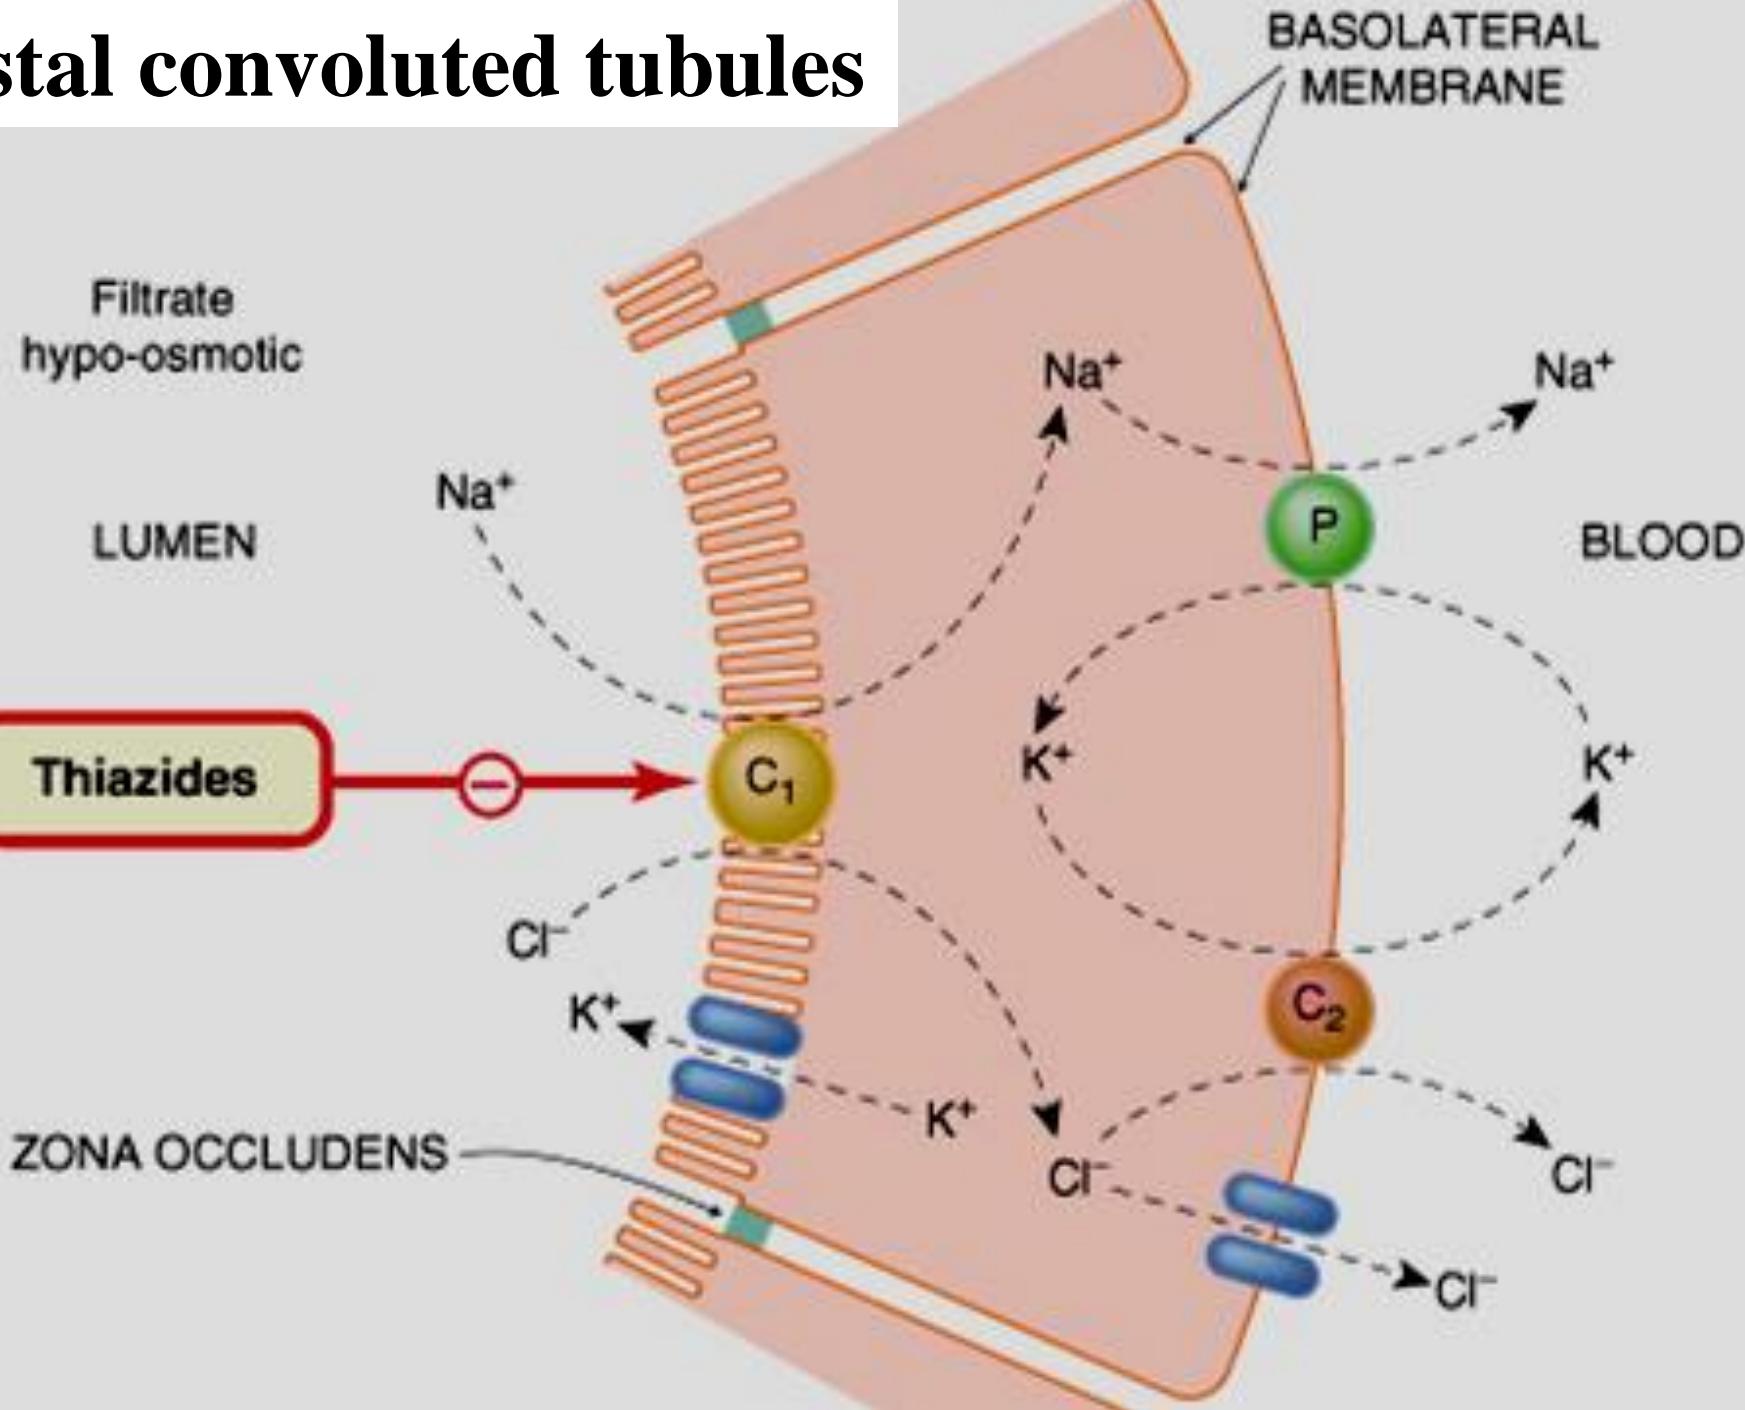

Thiazide diuretics

Mechanism of action:

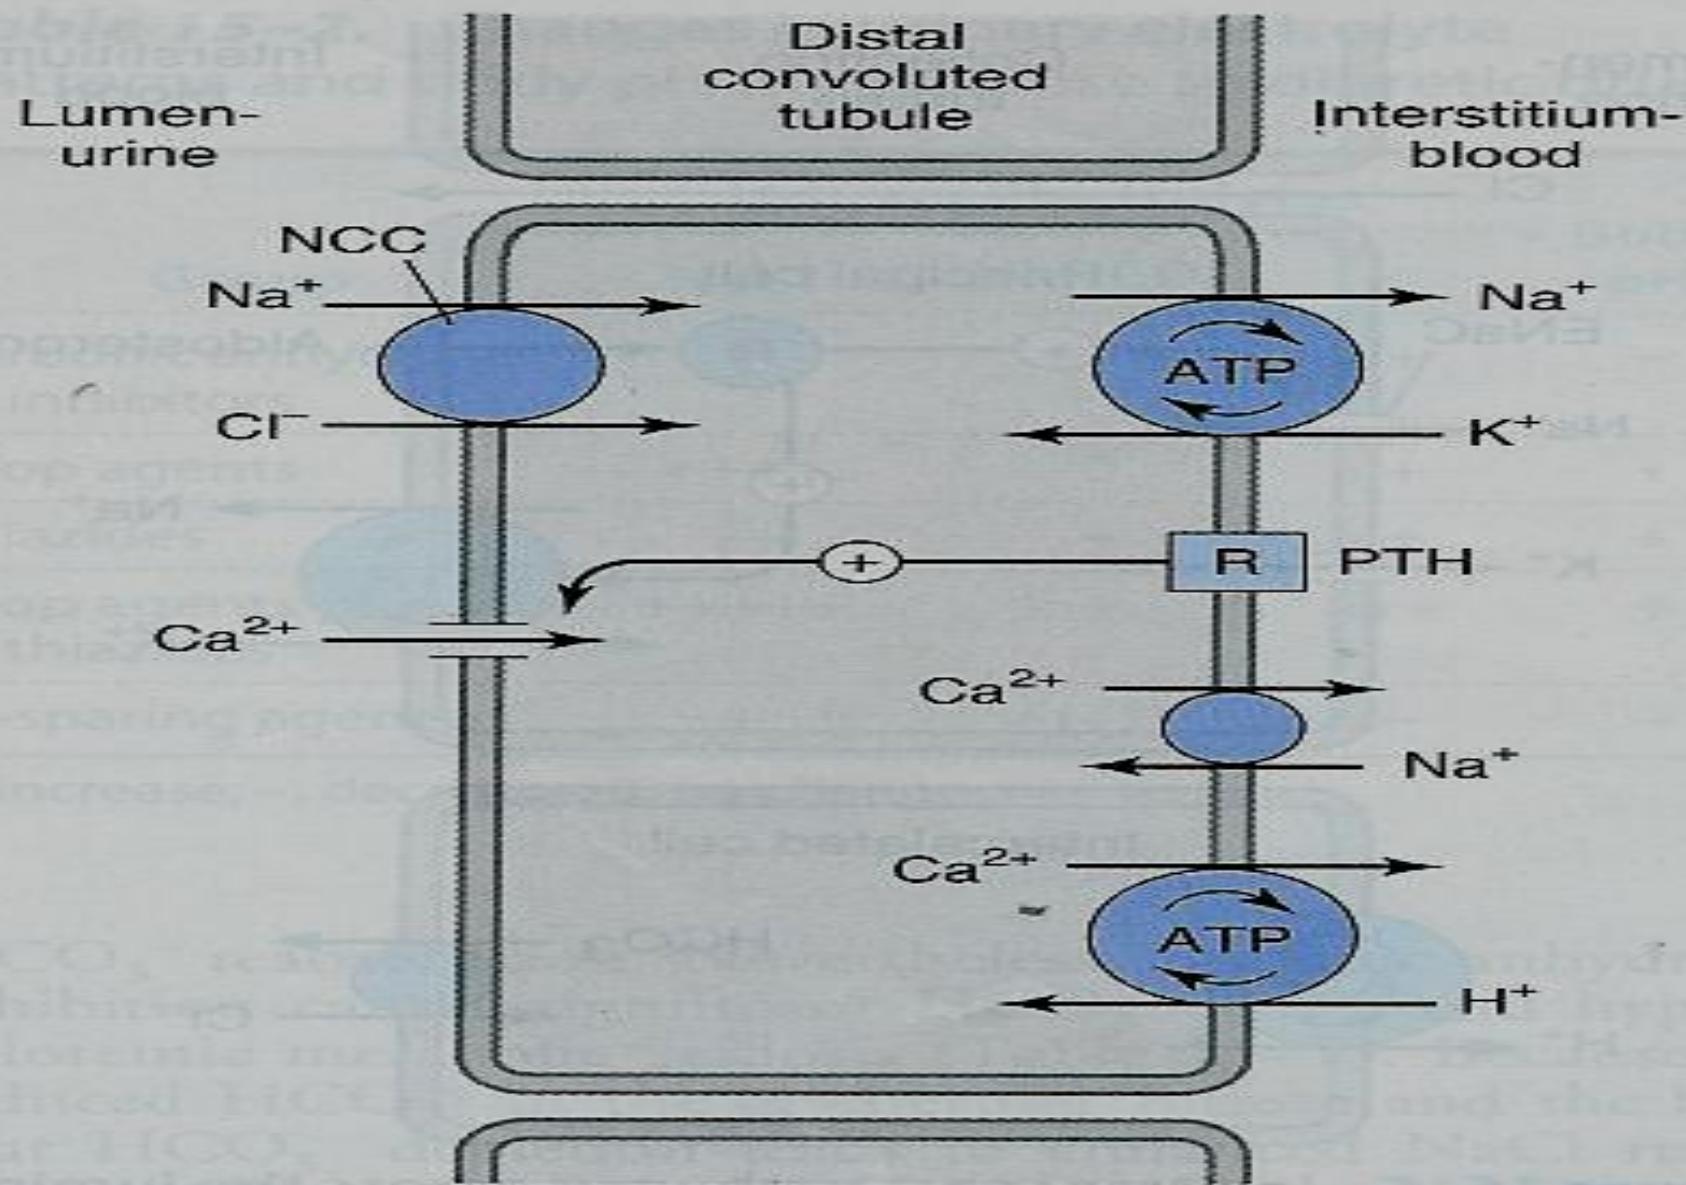

- acts via inhibition of Na/Cl co-transporter on the luminal membrane of distal convoluted tubules.
- **Efficacy:** Moderate natriuresis (5-10% of filtered load of sodium is reabsorbed).

Distal convoluted tubules

Mechanism of action of thiazide diuretics

Pharmacokinetics:

- Given orally, slow of onset
- long duration of action (40 h)
- are secreted by active tubular secretory system of the kidney
- may interfere with uric acid secretion and cause *hyperuricemia*

Pharmacological effects:

- ↑ urinary NaCl excretion
- ↑ urinary K excretion (**Hypokalemia**)
- ↑ urinary magnesium excretion
- ↓ urinary calcium excretion
- ↑ calcium re-absorption **hypercalcemia**

Thiazide diuretics

Decreased urinary excretion

Increased urinary excretion

Na^+

K^+

Ca^{2+}

Volume of urine

Uses:

- Treatment of essential hypertension (*cheap-well tolerated*).
- Treatment of mild heart failure (*to reduce extracellular volume*).

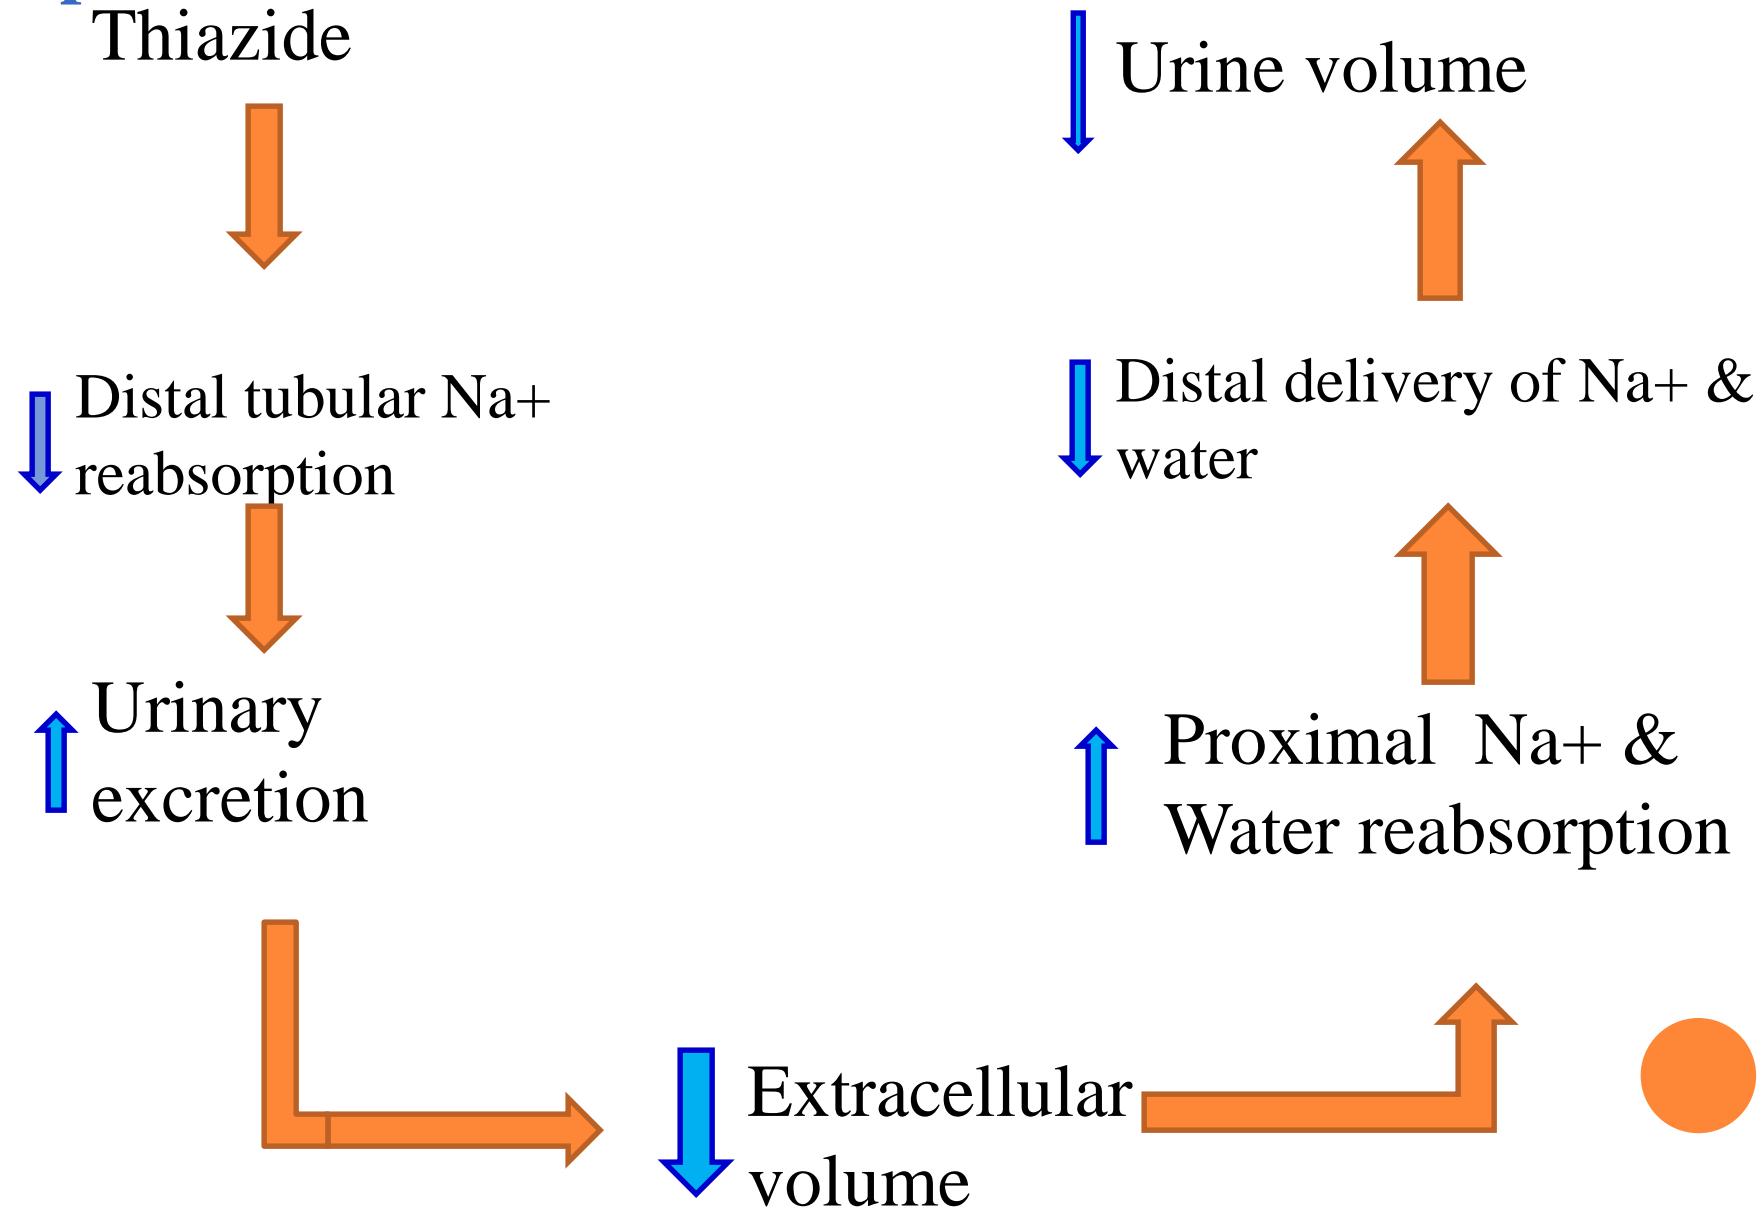

Uses:

- Calcium nephrolithiasis due to hypercalciuria (*to increase calcium re-absorption and decrease renal calcium stones*)
- Nephrogenic diabetes insipidus (*decrease blood volume and GFR*)

Mechanism of antidiuretic effect of thiazide in diabetes insipidus

Adverse effects:

- Fluid and electrolyte imbalance
- Hyponatremia
- Hypovolemia (volume depletion)
- Hypokalemia
- Metabolic alkalosis.
- Hyperuricaemia (gout)
- Hypercalcemia
- Hyperglycaemia
- Hyperlipidemia

ADVERSE EFFECTS

Volume
Depletion

Hypokalemia

Hypocalcaemia

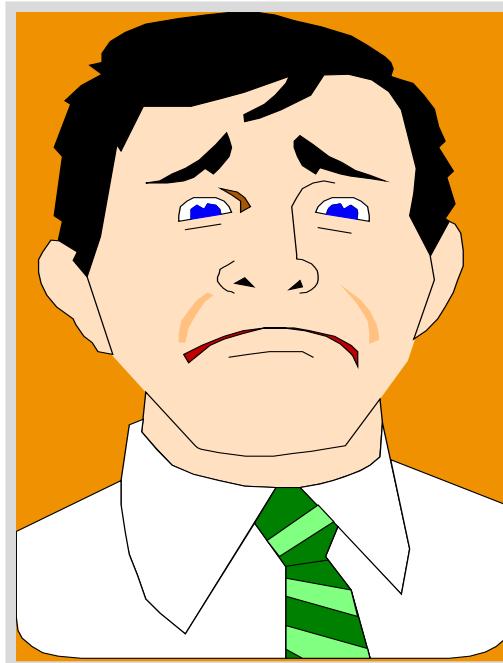

Hypomagnesaemia

Hyperlipidemia

Metabolic
Alkalosis

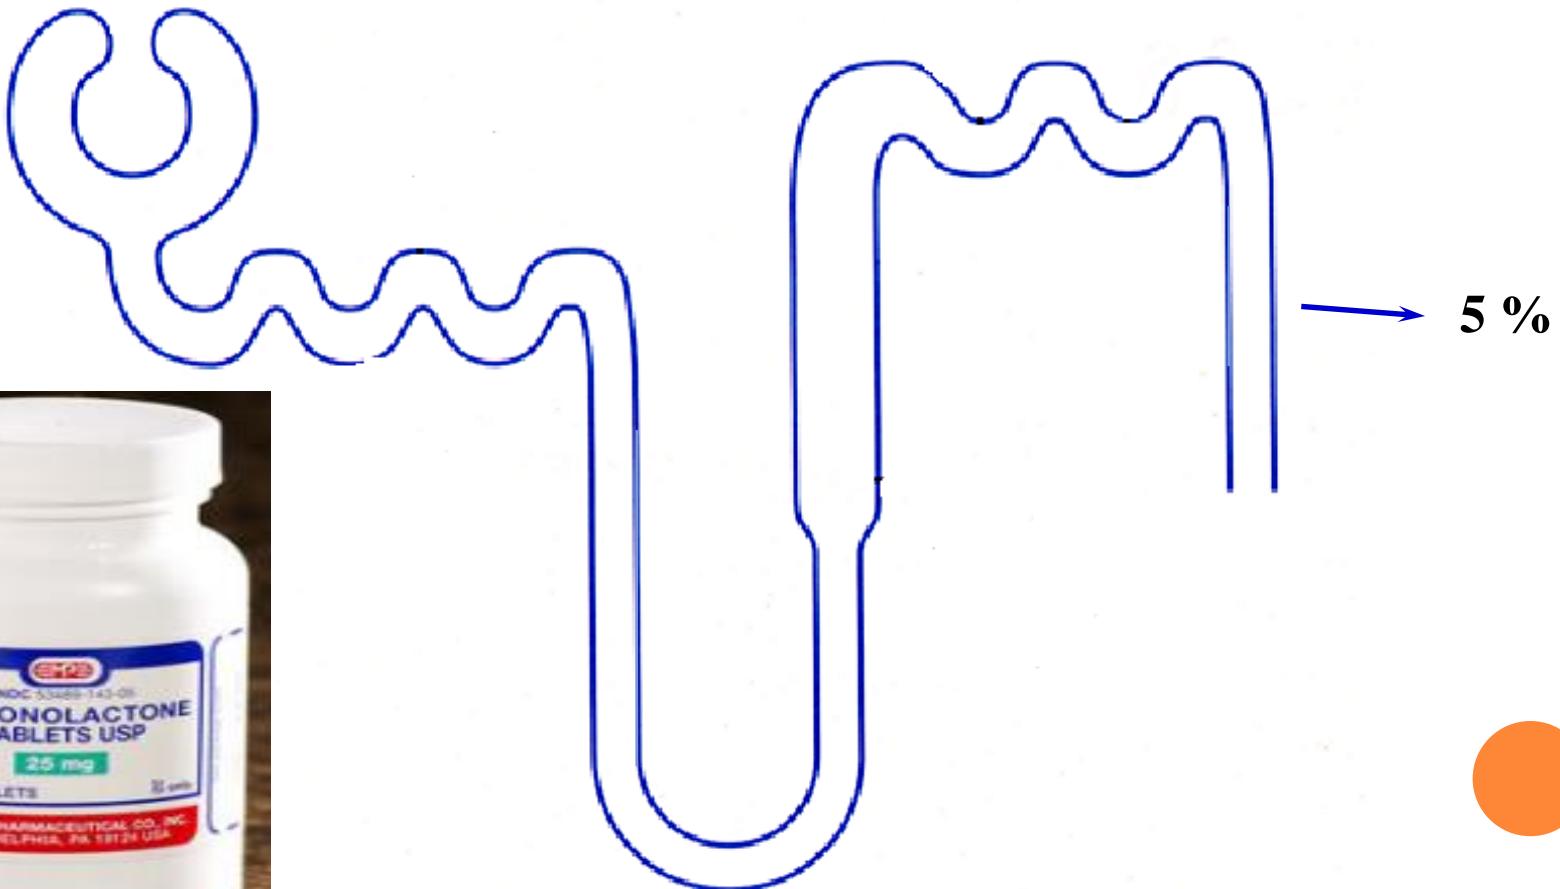

Hyperuricemia

Hyperglycemia

Potassium-sparing diuretics

Amiloride
Triamterene
Spironolactone

Potassium-sparing diuretics

Steroids

Nonsreroiods

Aldosterone antagonists

- Spironolactone

**Na^+ channels
inhibitors**

- Amiloride
- Triamterene

Mechanism of action

- Act in collecting tubules and ducts by inhibiting Na re-absorption and K & H excretion (**K-sparing effect**) by either:
 - Inhibition of Na influx through Na channels in the luminal membrane (**triamterene – amiloride**).

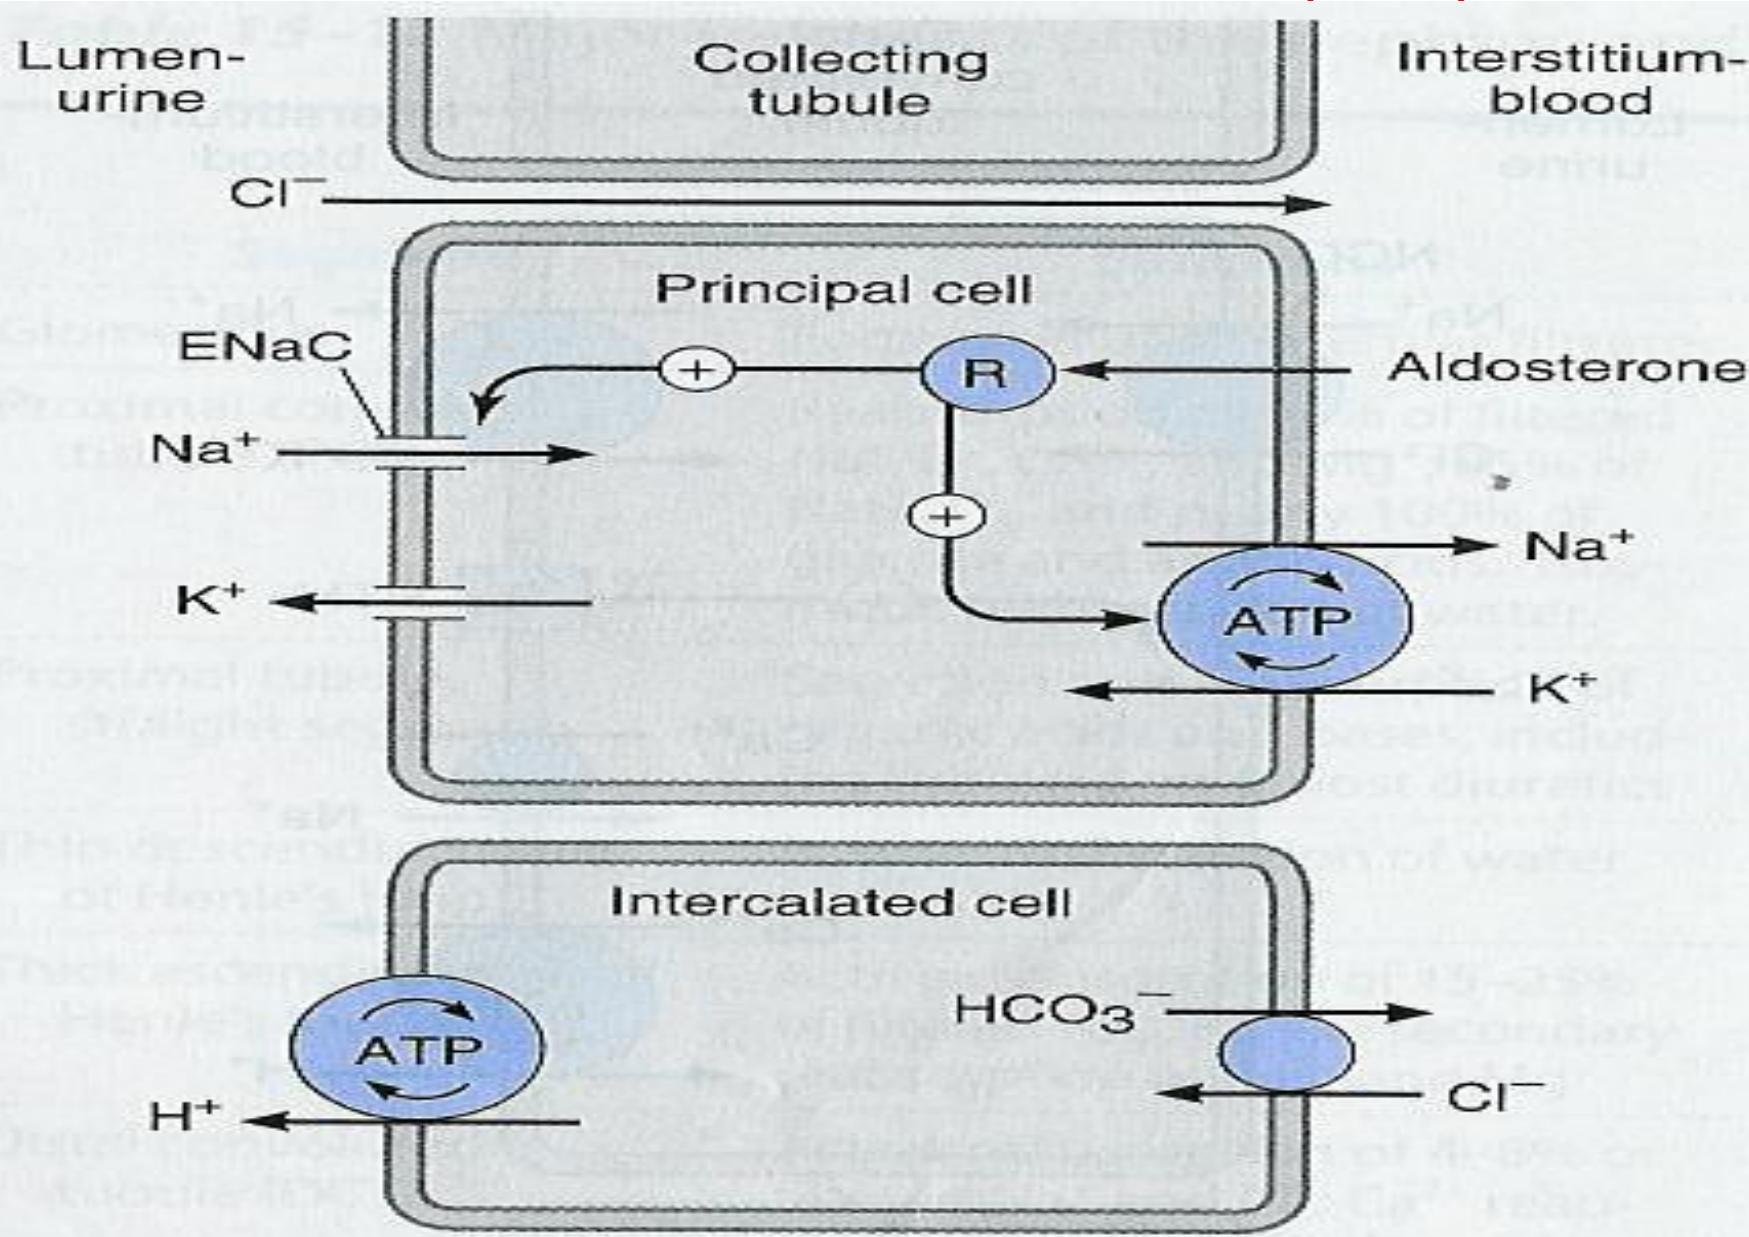

Mechanism of action

- **Spironolactone:** by antagonizing cytoplasmic aldosterone receptors

COLLECTED TUBULES (CT)

Pharmacodynamics:

- ↑urinary Na^+ excretion
- ↓urinary K^+ excretion **Hyperkalemia**
- ↓ H^+ excretion **(acidosis)**

Therapeutic uses:

- Drug of choice for patients with hepatic cirrhosis
- Secondary hyperaldosteronism
(CHF, hepatic cirrhosis, nephrotic syndrome).
- Treatment of hypertension
(combined with thiazide or loop diuretics to correct for hypokalemia).

Adverse Effects

- Hyperkalaemia.
- Metabolic acidosis.
- Gynaecomastia
- GIT upset and peptic ulcer

Contraindications:

- **Hyperkalaemia:** as in chronic renal failure, K⁺ supplementation, β-blockers or ACE inhibitors.
- **liver disease** (dose adjustment is needed).

Therapeutic applications of diuretics

Treatment of hypertension:

- o Thiazide diuretics
- o used alone or in combination with beta-blockers at low-dose (fewer side effects)
- o In presence of renal failure, loop diuretic is used.

Edema States Thiazide diuretic is used in mild edema with normal renal function

- o Loop diuretics are used in cases with impaired renal function.

Congestive Heart failure

- Thiazides may be used in only mild cases with well-preserved renal function
- Loop diuretics are much preferred in severe cases especially when GF is lowered
- In life-threatening acute pulmonary edema, furosemide is given IV.

Renal failure

- Thiazides are used till GFR \geq 40-50 ml/min
- Loop diuretic are used below given values, with increasing the dose with as GFR goes down.

Diabetes inspidus

Large volume(>10 L/day) of dilute urine
thiazide diuretics reduces urine volume

Hepatic cirrhosis with ascites

- Spironolactone is of choice.

Diuretics	Mechanism of action	Effects
CA inhibitors Acetohexamide Dorzolamide	Inhibition of NaHCO ₃ reabsorption in PCT	↑ Urinary Na HCO ₃ , K Urinary alkalosis Metabolic acidosis
Osmotic diuretic Mannitol	Osmotic effect in PCT	↑Urine excretion ↑ Little Na
Loop diuretics Furosemide	Na/K/2Cl transporter in TAL the most effective	↑Urinary Na, K, Ca, Mg
Thiazide diuretics hydrochlorothiazide	Na and Cl cotransporter in DCT	↑Urinary Na, K, Mg BUT ↓ urinary Ca (hypercalcemia) Metabolic alkalosis
K-sparing diuretic Spironolactone.	competitive antagonist of aldosterone in CCT	↑ Urinary Na ↓ K, H secretion Metabolic acidosis

Diuretics	Uses
CA inhibitors Acetohexamide Dorzolamide (topically) for glaucoma	Glaucoma, epilepsy Mountain sickness Alkalosis Phosphatemia
Osmotic diuretic Mannitol	<ul style="list-style-type: none"> Cerebral edema, glaucoma Acute renal failure, drug toxicities
Loop diuretics Furosemide	Acute pulmonary edema (Drug of choice) Heart failure Hyperkalemia, Hypercalcemia
Thiazide diuretics hydrochlorothiazide	Commonly used Hypertension, mild heart failure, nephrolithiasis, diabetes insipidus
K-sparing diuretic Spironolactone.	Hepatic cirrhosis (Drug of choice)

Diuretics	Side effects
CA inhibitors Acetohexamide Dorzolamide	Metabolic acidosis , Urinary alkalosis Hypokalemia
Osmotic diuretic Mannitol	Extracellular water expansion Dehydration Hypernatremia
Loop diuretics Furosemide	Hypokalemia, hypovolemia, hyponatremia, hypomagnesemia, hypocalcemia Precipitate gout, alkalosis
Thiazide diuretics hydrochlorothiazide	Hypokalemia, hyponatremia, hypovolemia, hypomagnesemia, hypercalcemia Alkalosis, precipitate gout Hyperlipidemia, hyperglycemia
K-sparing diuretic Spironolactone.	Gynaecomastia Hyperkalaemia , Metabolic acidosis. GIT upset and peptic ulcer
