Chapter 8 Pages 270-276 Chapter 11 Pages 357-381

Objectives

- To describe antigen recognition by T cells
- To describe the pathways involved in processing endogenous and exogenous antigens
- To discuss self MHC restriction in Ag presentation to T cells
- To describe the induction of cell meditated immunity (Chronic Inflammation)

Other cells

Cell Mediated Immunity (CMI)

 T cells (lymphocytes) via their receptors bind to the surface of other cells (Antigen Presenting Cells) that display the processed antigen and trigger a response

 Mononuclear cell inflammatory process usually associated with chronic inflammations

Antigen Presenting cells

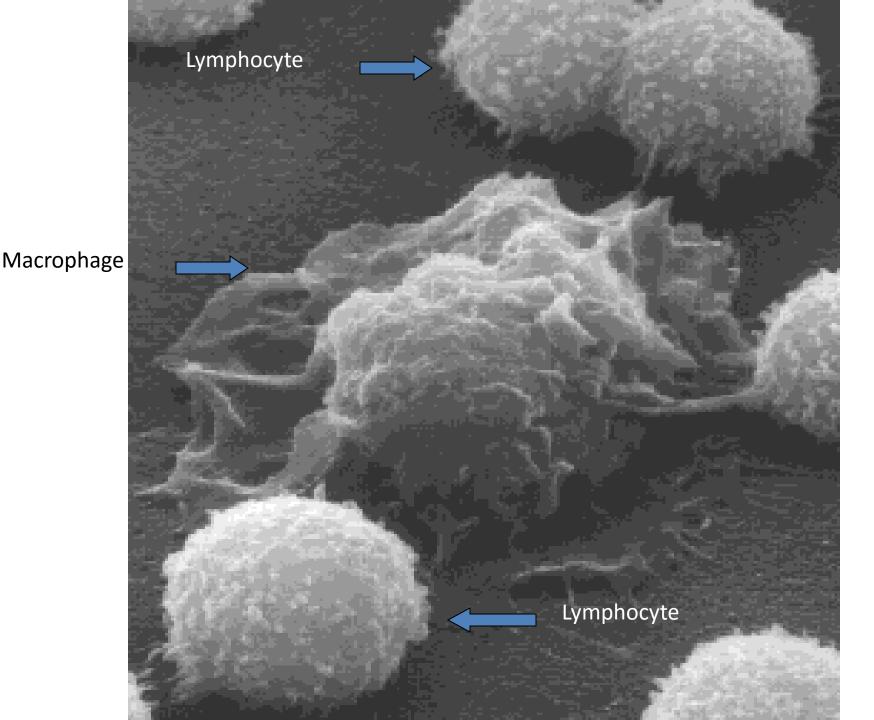

Monocytes: Peripheral blood

Macrophages: Tissues

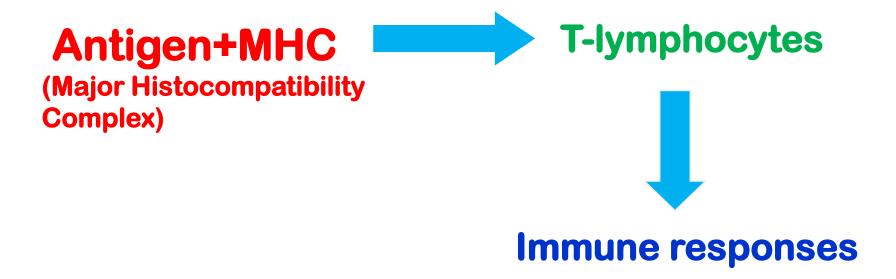

Dendritic cells: Lymphoid tissues, skin

(Langerhans cells)

B-cells: Lymphoid tissue, Blood

Cell-Mediated Immunity (CMI)

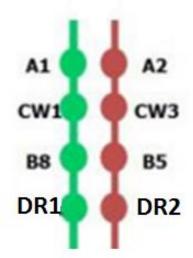

Major Histocompatibility Complex (MHC)

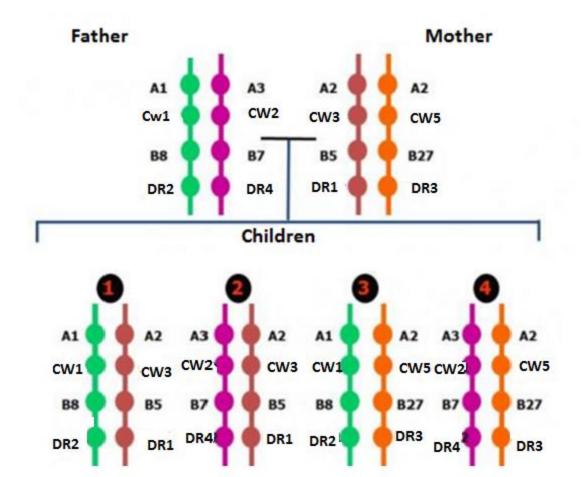

- Major histocompatibility complex (MHC) proteins were discovered for the first time when tissue transplantation started
- The success of tissue and organ transplantation depends upon the match of donor's and recipient's "human leukocyte antigens" (HLA) encoded by HLA genes
- Genes for HLA proteins are clustered in the MHC complex located on the short arm of chromosome 6

MHC

• Each individual has two "haplotypes" ie, two sets of these genes one paternal and c maternal

- MHC Class I molecules are found on the surface of virtually all nucleated cells
- MHC Class II molecules are normally present of the surface of antigen presenting cells such as:
 - Marophages,
 - Dendritic cells
 - B cells

Biologic Importance of MHC

Antigen recognition

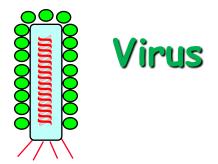

- T cytotoxic (CD8) cells kill virus infected cells in association with class I MHC proteins
- T helper (CD4) cells recognize antigen in association with class II MHC proteins

This is called MHC restriction

- Transplantation
 - Success of organ transplant is determined by compatibility of the MHC genes

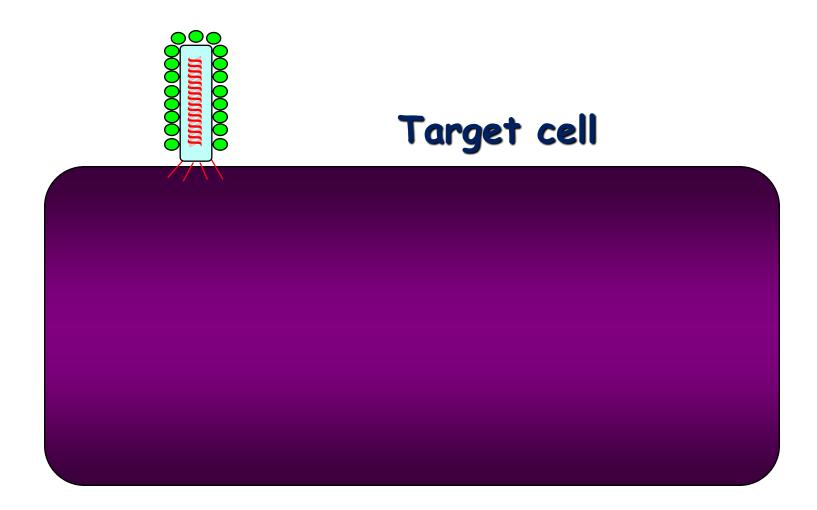

1. Endogenous antigen (Cytoplasm)

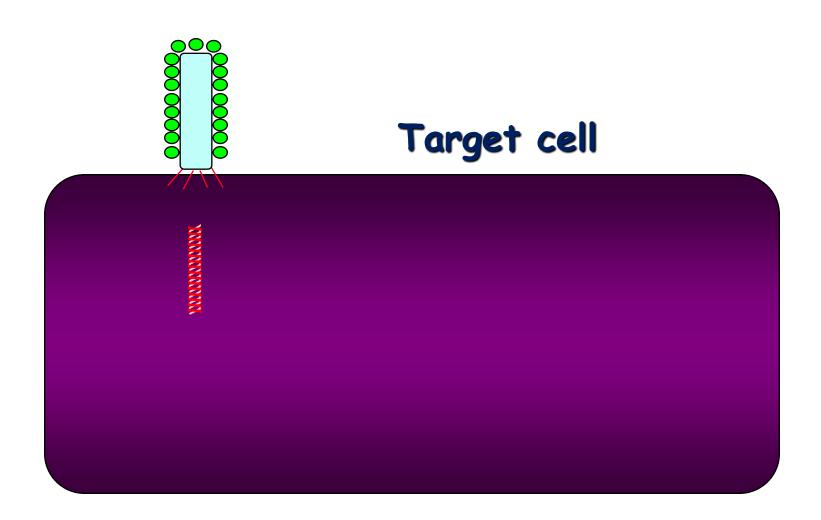

2. Exogenous antigen (Membrane Bound)

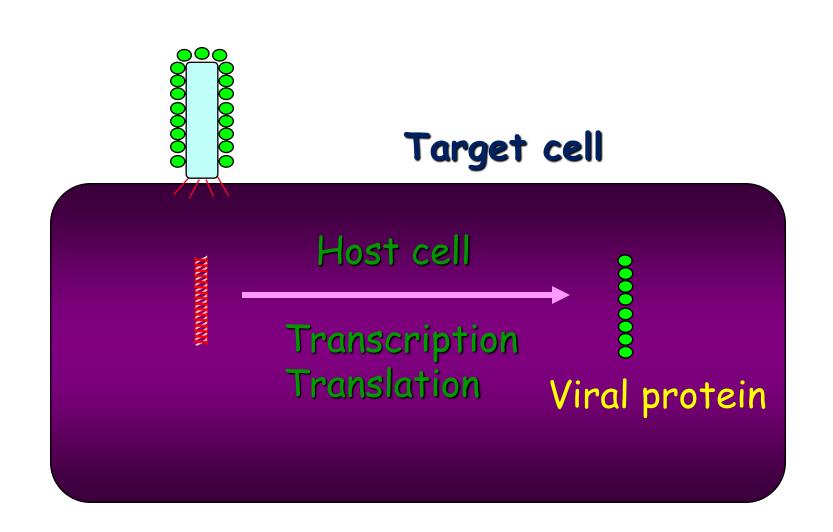

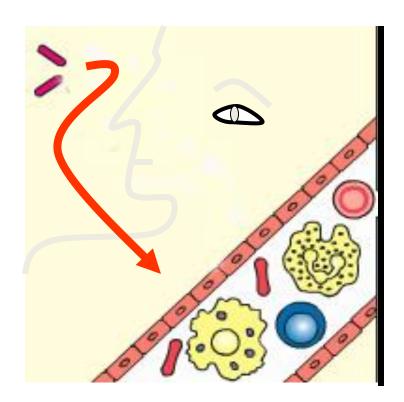

Target cell

Exogenous antigen

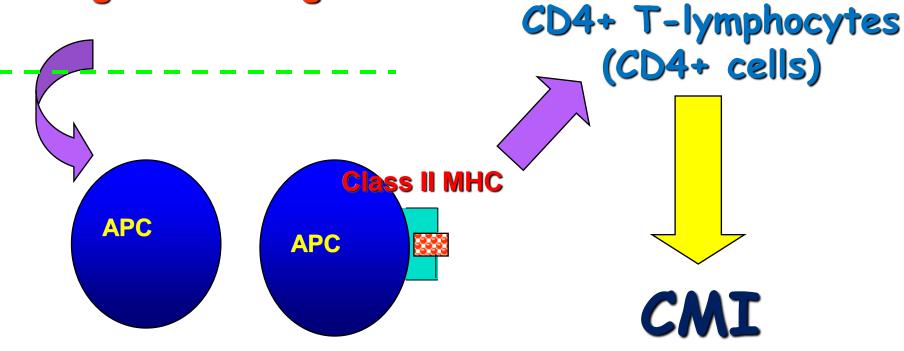

Cell-mediated immunity

Exogenous antigen

Antigen presenting cells

Monocytes/Macrophages

Dendritic cells

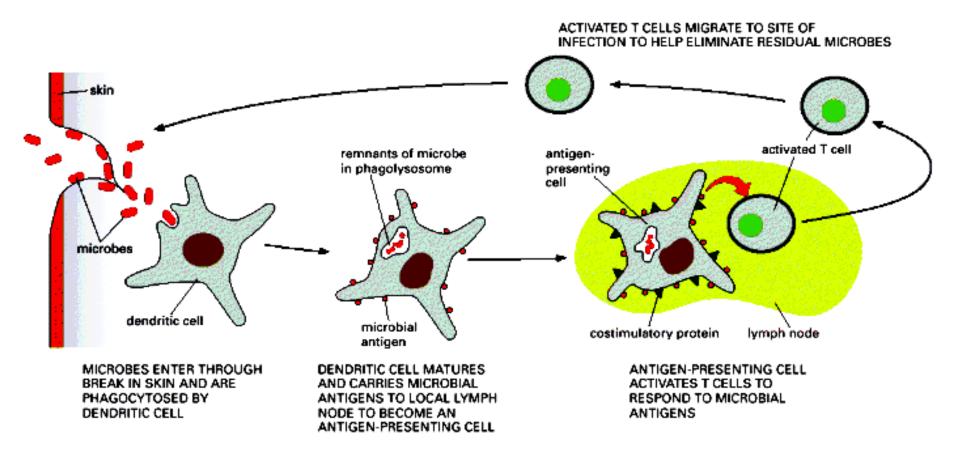

Langerhans cells

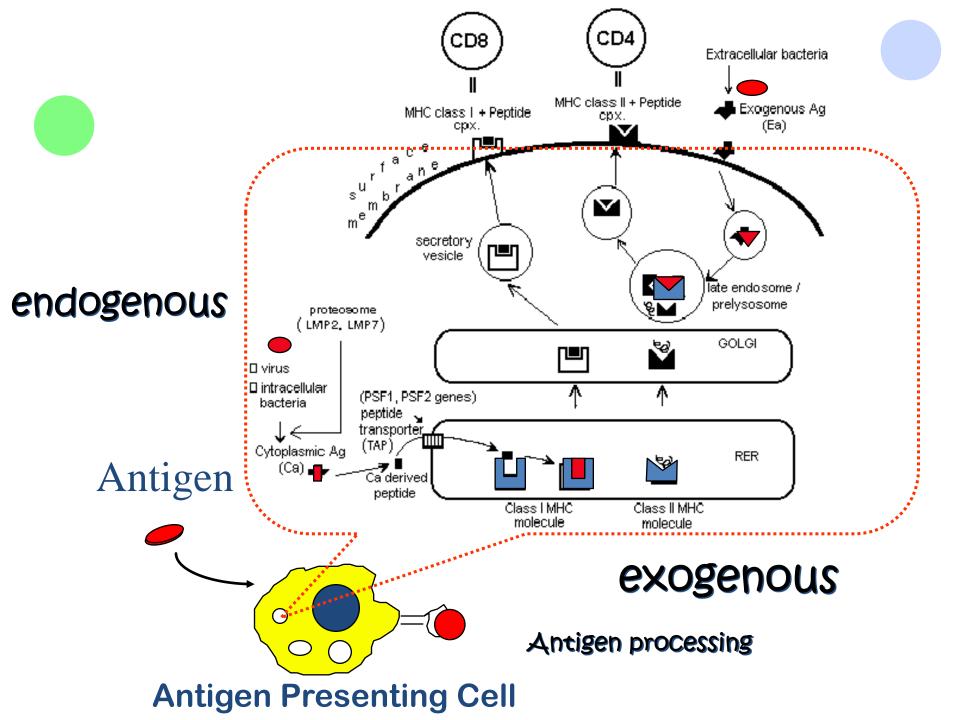

B-cells

(Cell Mediated Immunity)

Antigen Presenting Cells

•Dendritic cells and macrophages digest invading microbe and then present the antigen of the microbe to lymphocytes in lymphoid organs.

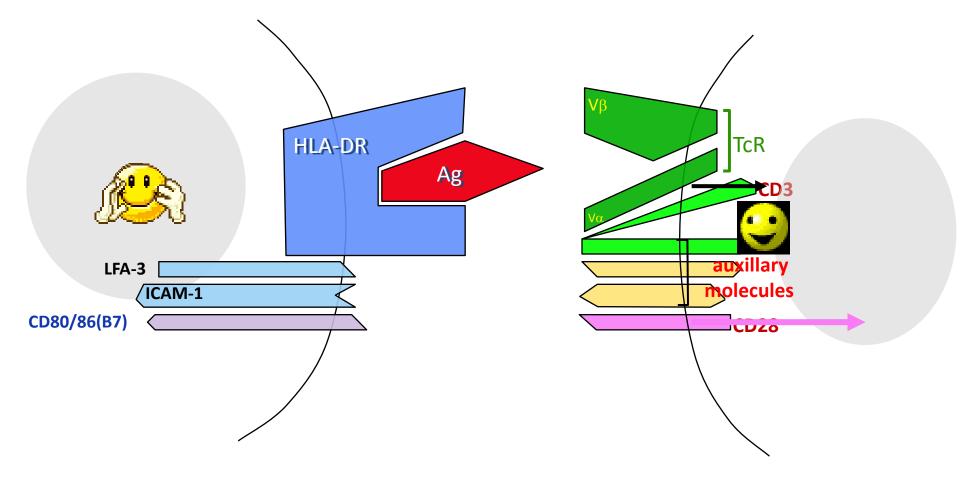

Two signals are required of activation of T cells

- Two signals are required to activate T cells
- First signal

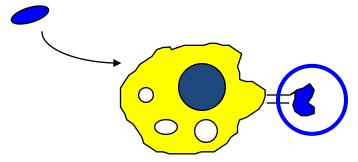

```
<u>Class II MHC + antigen – TCR</u>
IL-1, LFA-1 with ICAM
```

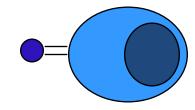

Second signal (Costimulatory signal)
 B7 on APC interacts with CD28 on lymphocyte

B7 on APC interacts with CD28 on lymphocyte

Trimolecular complex

T lymphocytes ("T cells"): CMI

- Subsets include:
 - CD4+ helper T cells enhance CMI and production of antibodies by B cells

CD8+ cytotoxic T lymphocytes (CTLs)
 that kill virus-infected and tumor cells

Out come of T helper cell activation

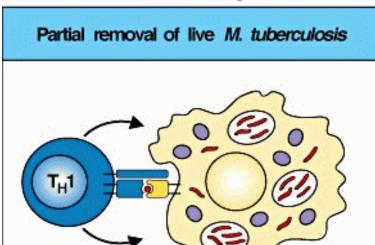

Production of IL-2 and its receptor

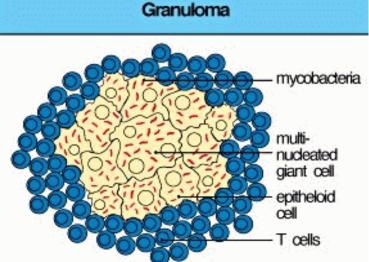

- IL-2 is also know as T cell growth factor
- Proliferation of antigen specific T cells
- Effector and regulatory cells are produced along with "memory" cells
- IL-2 also stimulates CD8 cytotoxic cells

Production of Interferons

Enhances anti-microbial activity of macrophages

Granuloma Formation (Chronic Inflammation, e.g., TB)

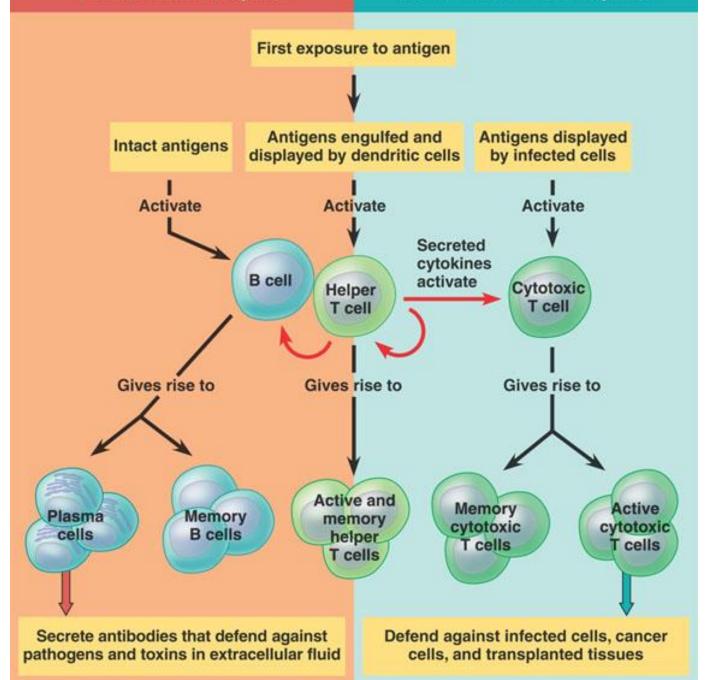

Out come of T helper cell activation

Memory T cells

- Respond rapidly for many years after initial exposure to antigen
- A large number of memory cells are produced so that the secondary response is greater than the primary
- Memory cells live for many years and have the capacity to multiply
- They are activated by smaller amount of antigen
- They produce greater amounts of interleukins

Examples of Cell Mediated Immunity

1. Delayed type of hypersensitivity (DTH) reaction:

the tuberculin test

Mediated by CD4+ T cells and takes about 72 hours to develop

2. Contact hpersensitivity

- Many people develop rashes on their skin following contact with certain chemicals such as nickel, certain dyes, and poison ivy plant
- The response takes some 24 hours to occur and like DTH, is triggered by CD4+ T cells

Contact Dermatitis

Take Home Message

- Cell mediated adaptive immune response is specific and develops after exposure to a pathogen (antigen)
- Initial antigen exposure results in generation of memory cells for a stronger and a quicker response against future exposures to the same pathogen
- It is usually associated with chronic infections
- Antibodies are not involved
