

# Determination of the Differential & total Leukocyte Count (DLC&TLC)

- This slides contain both (Slides + Handout)
- Procedures in Female slide and handout are the same .Therefore ,we put it as one procedure

**Red: very important.**

Green: only found in males' slides.

Purple: only found in females' slides.

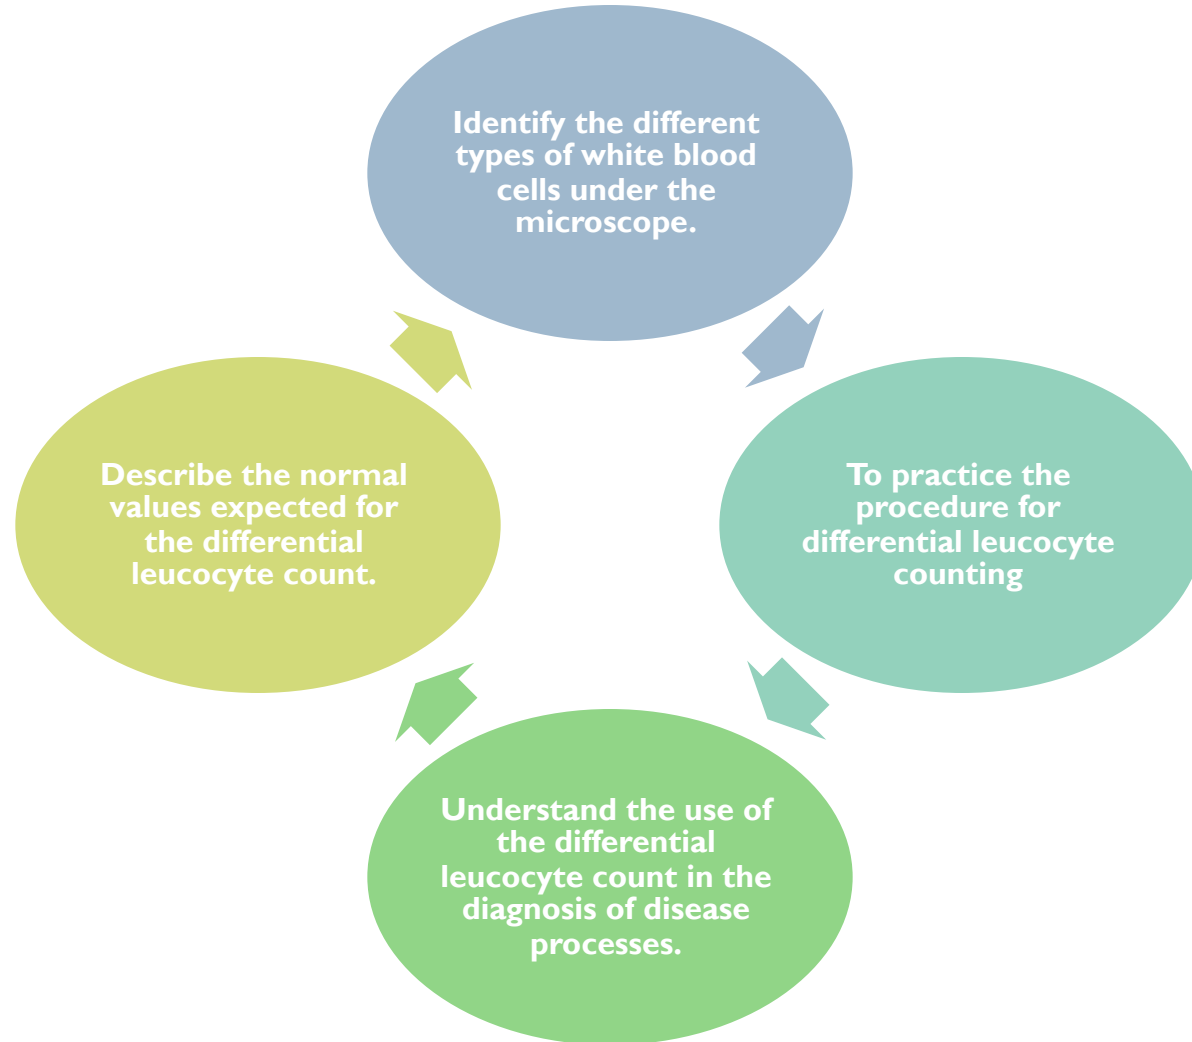

Gray: notes.

**Physiology Team 436 – Foundation block – Practical  
( lecture 2- DCL )**

يامالك الملك وكلناك أمرنا واستودعناك همومنا  
{ فبشرنا بما يفتح مداخل السعادة إلى قلوبنا }

# Objectives

---

# Introduction

---

## What is Differential Leukocyte Count (DLC) ?

- DLC is a routine test in hospitals which determine the percentage of each type of white blood cells in the total leucocyte population.
  - Each type of WBCs performs a different function against infections and each type of infection yields a different white cell picture in the blood.
  - Each type of WBCs has unique morphology and staining characteristics, which is responsible to specify the type of the cells.
- 

النسب الحمراء هي بملزمة البنات  
واللي الدكتور حرس عليها

# Types of WBC

**Never Let Monkey Eat Banana**  
Neutrophil , Lymphocyte , Monocyte , Eosinophil , Basophil  
Most common → less common

كرات الدم البيضاء ذات النواة  
المتعددة الأشكال.

Agranular = A means not

## 1. Granular (polymorphnuclear PMN )

## 2. A Granular

### Neutrophil

Most commonly  
seen white blood  
cells in the  
circulating blood  
(40/50 -70)%

### Eosinophil

Less common in  
the blood stream  
(1-6%). Some  
sources say (1-3 %)

### Basophil

The rarest of all  
white blood cells  
found in the blood  
(0-1%). Or (0.4-1%)

### Monocytes

About 4-6% or 5-  
10% of the blood  
cells

### Lymphocyte

About 25-35%  
of the blood  
cells

-Granular: is categorized by: COLOR

-A granular: is categorized by SIZE.

# Neutrophils (10-16um )

Some sources say 10-14 um

## Clinical application :

- It will increase in acute bacterial or fungal infections. (pyogenic illness)

Nucleus	Cytoplasm:	Cytoplasmic granules
<ul style="list-style-type: none"> <li>• blue-violet</li> <li>• Complex <u>multi-lobed nucleus</u> (from 2 to 6 lobes) connected by chromatin threads.</li> <li>• Seen clearly through cytoplasm.</li> </ul>	<ul style="list-style-type: none"> <li>• slate-blue in color</li> </ul>	<ul style="list-style-type: none"> <li>• Small</li> <li>• Fine, closely-packed violet(purple)-pink.</li> <li>• Not seen separately</li> <li>• Give ground-glass appearance</li> <li>• Do not cover nucleus</li> </ul>

They have small cytoplasmic granules take a neutral (purple or pink) color with various stains such as Wright's stain.

# Eosinophils (10-15um)

## Clinical Application :

- It will increases in parasitic infections and allergies.

Nucleus	Cytoplasm	Cytoplasmic granules
<ol style="list-style-type: none"> <li>1. Blue-violet .</li> <li>2. 2-3 lobes. often is a <u>dumbbell-shaped nucleus</u> (bi-lobed). Lobes connected by thick or thin <u>chromatin band</u>.</li> <li>3. Seen clearly through cytoplasm.</li> </ol>	<ul style="list-style-type: none"> <li>• Eosinophilic</li> <li>• Light pink/red</li> <li>• Granular</li> </ul>	<ul style="list-style-type: none"> <li>• Large , prominent , coarse , <b>red</b> to orange (eosinophilic) granules</li> <li>• uniform size</li> <li>• Seen seperatley</li> <li>• Do not cover the nucleus</li> </ul>

Nucleus is rarely more than bilobed, but is pyknotic with a deep blue-purple color

Numerous red-orange granules of uniform size

Any thing with this color is from male slide (from the schedule that we put it as summary in slide no 13-14)

# Basophils (10-15um)

- **Clinical application** : It will increase in allergies and malignancies.

Nucleus	Cytoplasm	Cytoplasmic granules
<ul style="list-style-type: none"> <li>• Blue-violet.</li> <li>• Not clearly Seen through cytoplasm because <u>it is covered by large granules.</u> (somewhat hidden)</li> <li>• Irregularly shaped; may be S shaped</li> <li>• rarely (bi-lobed).</li> </ul>	<ul style="list-style-type: none"> <li>• Basophilic</li> <li>• Bluish</li> <li>• Granular</li> </ul>	<ul style="list-style-type: none"> <li>• Basophilic</li> <li>• Large, very coarse</li> <li>• Variable size</li> <li>• Deep purple</li> <li>• Seen separatley</li> <li>• Completely fill the cell, cover the nucleus</li> </ul>

granules contain **Heparin** (an anticoagulant). and **Histamine** which increases the permeability of capillary walls.

Numerous large, dark blue-violet granules that tend to be closely packed

Nucleolus is smaller round, non-segmented and stains lighter than the remainder of the cell

Any thing with this color is from male slide (from the schedule that we put it as summary in slide no 13-14)

# Monocytes

- It is the largest of all white blood cells in size (12-20um).
- **Clinical application** : it will increase in chronic infections.

Nucleus	Cytoplasm:	Cytoplasmic granules
<ul style="list-style-type: none"> <li>• Pale blue-violet,</li> <li>• Large single</li> <li>• May be indented horseshoe-shaped, or <u>kidney-shaped</u> ( can appear oval or round if seen from the side)</li> </ul>	<ul style="list-style-type: none"> <li>• slate-blue in color.</li> <li>• Abundant</li> <li>• “frosty”</li> <li>• Amount may be larger than that of nucleus</li> </ul>	<ul style="list-style-type: none"> <li>•do not contain any granules.</li> </ul>

Any thing with this color is from male slide (from the schedule that we put it as summary in slide no 13-14)

# Lymphocytes

## General characteristics:

- Deep blue-violet
- Small, spherical cells with large, round nucleus in each of them.
- The Nucleus occupies most of the volume of the cell, leaving only a thin crescent rim of Cytoplasm around it.
- The cytoplasm of these cells does **not contain any granules**.
- It will increase in **acute** viral infections (**infectious mononucleosis**) and malignancies .

Large Lymphocytes

Small Lymphocytes

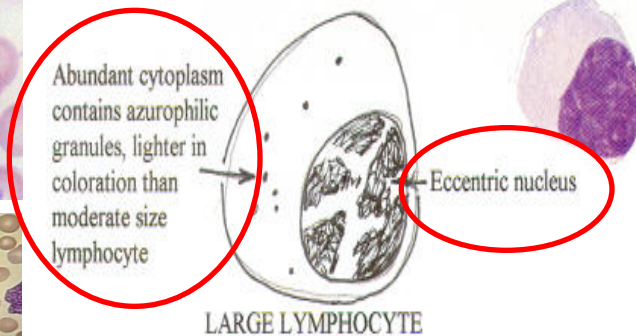

Small and Large Lymphocytes are explained in next slide

# Large and small Lymphocytes (male slide)

	Large lymphocyte	small lymphocyte
<b>Nucleus</b>	<ul style="list-style-type: none"> <li>• Deep blue-violet</li> <li>• Single, large, round or oval, almost fills cell.</li> <li>• May be central or eccentric</li> </ul>	<ul style="list-style-type: none"> <li>• Deep blue-violet</li> <li>• Single, large, round, almost fills cell.</li> <li>• Condensed lumpy chromatin, gives “ink spot” appearance.</li> </ul>
<b>Cytoplasm</b>	<ul style="list-style-type: none"> <li>• Large crescent of clear, light blue cytoplasm</li> <li>• Amount larger than in small lymphocyte</li> </ul>	<ul style="list-style-type: none"> <li>• Hardly visible</li> <li>• Thin crescent of clear, light blue cytoplasm</li> </ul>
<b>Cytoplasmic granules</b>	No visible granules	
<b>Exist and Size</b>	(5-10%) , (10-15 um)	(20-40%) (7-9 um)

Large

Small

# DLC Equipment & Procedures : DIFFERENTIAL LEUCOCYTE COUNT

## Equipment

## Procedures

Using various dyes + microscope slide

1. Prepare a stained blood film with the help of Wright's stain

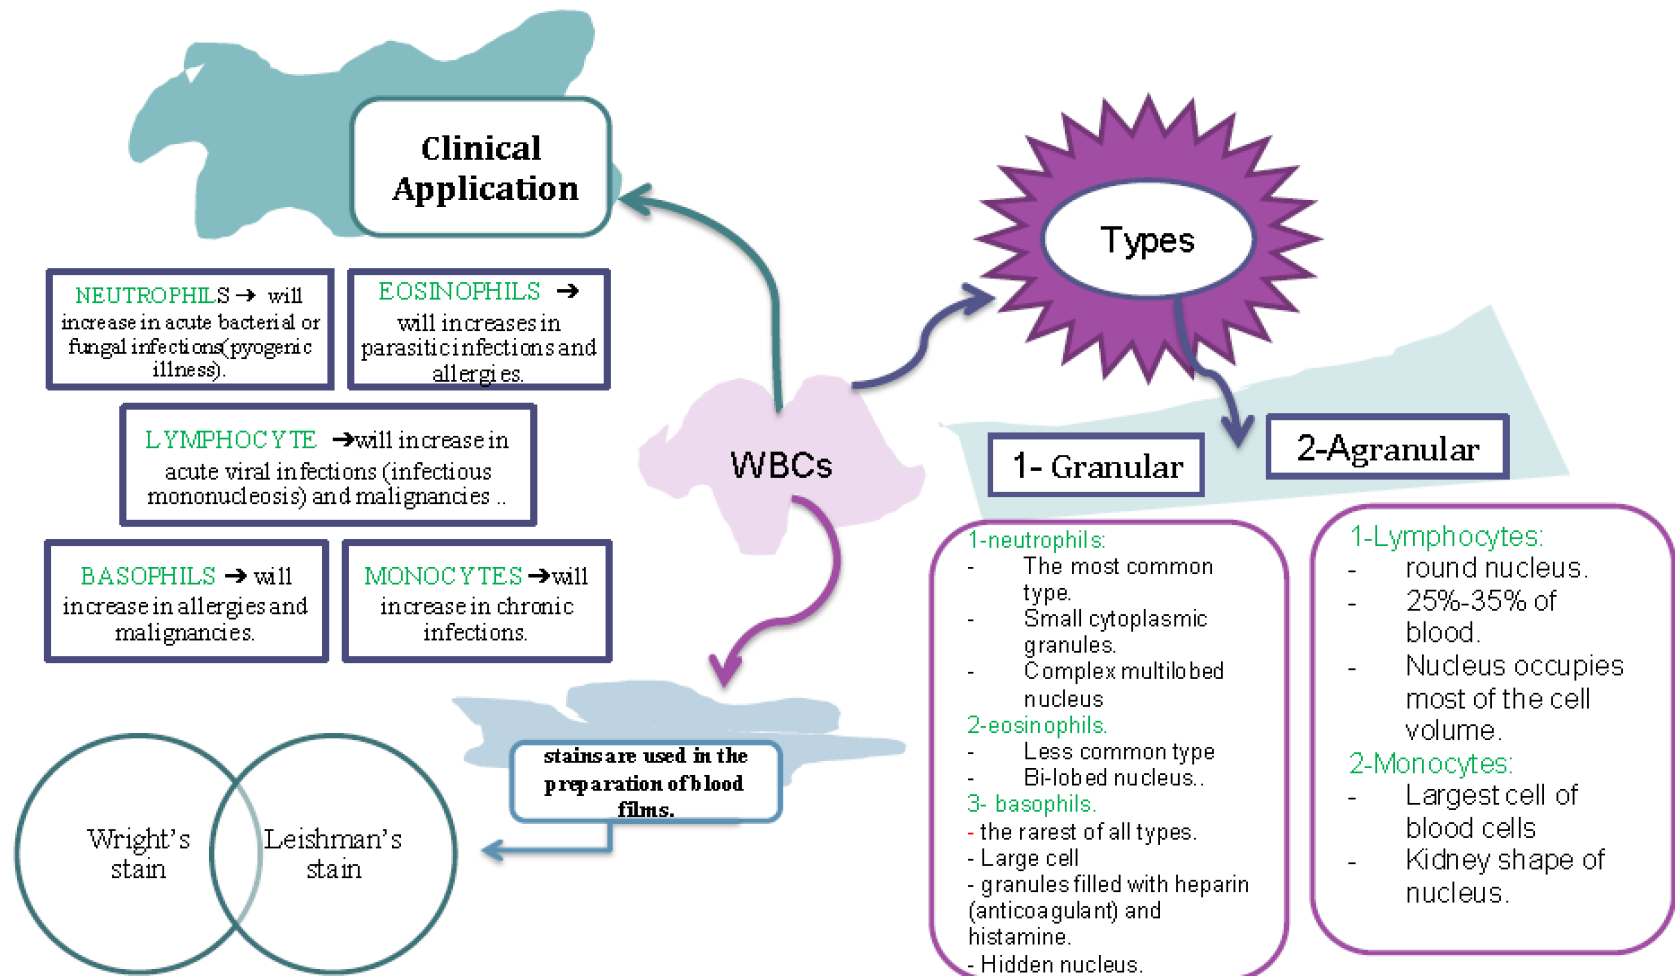

Using microscope with an oil immersion objectives + Mineral or Cedar wood oil

2. Set the stained blood film under the oil immersion objective lens in a light microscope

3. Identify various types of white blood cells according to their histological characteristics , count about 100 cells

# Summary

TABLE 1.2

Appearance of white blood corpuscles in a stained blood film

<i>Cell type</i>	<i>Diameter (<math>\mu\text{m}</math>)</i>	<i>Nucleus</i>	<i>Cytoplasm</i>	<i>Cytoplasmic granules</i>
<b>Granulocytes</b>				
Neutrophils (40-70%)	10-14 (1.5-2X a RBC)	<ul style="list-style-type: none"> <li>• Blue-violet.</li> <li>• 2-6 lobes, connected by chromatin threads. Seen clearly through cytoplasm.</li> </ul>	<ul style="list-style-type: none"> <li>• Slate-blue in color.</li> </ul>	<ul style="list-style-type: none"> <li>• Fine, closely-packed violet-pink.</li> <li>• Not seen separately.</li> <li>• Give ground-glass appearance.</li> <li>• Do not cover nucleus.</li> </ul>
Eosinophils (1-6%)	10-15	<ul style="list-style-type: none"> <li>• Blue-violet</li> <li>• 2-3 lobes, often bi-lobed, lobes connected by thick or thin chromatin band.</li> <li>• Seen clearly through cytoplasm.</li> </ul>	<ul style="list-style-type: none"> <li>• Eosinophilic.</li> <li>• Light pink-red.</li> <li>• Granular.</li> </ul>	<ul style="list-style-type: none"> <li>• Large, coarse.</li> <li>• Uniform-sized.</li> <li>• Brick-red to orange.</li> <li>• Seen separately.</li> <li>• Do not cover nucleus.</li> </ul>
Basophils (0-1%)	10-15	<ul style="list-style-type: none"> <li>• Blue-violet.</li> <li>• Irregular shape, may be S-shaped, rarely bilobed.</li> <li>• Not clearly seen, because overlaid with granules.</li> </ul>	<ul style="list-style-type: none"> <li>• Basophilic.</li> <li>• Bluish.</li> <li>• Granular.</li> </ul>	<ul style="list-style-type: none"> <li>• Large, very coarse.</li> <li>• Variable-sized.</li> <li>• Deep purple.</li> <li>• Seen separately.</li> <li>• Completely fill the cell, and cover the nucleus.</li> </ul>

# Summary continue

## Agranulocytes

Monocytes (5-10%)	12-20 (1.5-3 X a RBC)	<ul style="list-style-type: none"><li>• Pale blue-violet.</li><li>• Large single.</li><li>• May be indented horse-shoe, or kidney shaped (can appear oval or round, if seen from the side).</li></ul>	<ul style="list-style-type: none"><li>• Abundant.</li><li>• 'Frosty'.</li><li>• Slate-blue.</li><li>• Amount may be larger than that of nucleus.</li></ul>	<ul style="list-style-type: none"><li>• No visible granules.</li></ul>
Small Lymphocyte (20-40%)	7-9	<ul style="list-style-type: none"><li>• Deep blue-violet.</li><li>• Single, large, round, almost fills cell.</li><li>• Condensed, lumpy chromatin, gives 'ink-spot' appearance.</li></ul>	<ul style="list-style-type: none"><li>• Hardly visible.</li><li>• Thin crescent of clear, light blue cytoplasm.</li></ul>	<ul style="list-style-type: none"><li>• No visible granules.</li></ul>
Large lymphocyte (5-10½)	10-15	<ul style="list-style-type: none"><li>• Deep blue-violet.</li><li>• Single, large, round or oval, almost fills cell.</li><li>• May be central or eccentric.</li></ul>	<ul style="list-style-type: none"><li>• Large, crescent of clear, light blue cytoplasm.</li><li>• Amount larger than in small lymphocyte.</li></ul>	<ul style="list-style-type: none"><li>• No visible granules.</li></ul>

# Summary

Blood element	% of leukocyte	Size $\mu$	Cytoplasmic staining	Nucleus morphology
Erythrocyte	-	7-8	pink, no granules	none
Neutrophil	50-70	10-12	salmon-colored small granules	Segmented, -2-5 lobed
Lymphocyte	25-35	7-8	Light blue, scant amount, no granules	Single large Oval purple
Monocyte	4-6	16-18	Basophilic, no granules	Large, kidney shaped
Eosinophil	1-3	13-14	Bright red coarse granules	bilobed purplish
Basophil	0-4-1	14-15	Large, basophilic granules	Bilobed bluish black

# Examine yourself !

| 4. | Monocyte    |
| 5. | lymphocytes |

Video describe WBCs :

▶ <https://www.youtube.com/watch?v=Tdx-U8S6ZMk>

# Examine yourself !

---

## 1. What are the normal values of each different type of white blood cells?

- ▶ NEUTROPHILS → 50 – 70 %
- ▶ EOSINOPHILS → 1 – 3 %
- ▶ BASOPHILS → 0.4 – 1 %
- ▶ MONOCYTES → 4 – 6 %
- ▶ LYMPHOCYTE → 25 – 35 %

## 2. Under what conditions are the percentages of the various types of white blood cells increased?

- ▶ NEUTROPHILS → will increase in acute bacterial or fungal infections.
  - ▶ EOSINOPHILS → will increase in parasitic infections and allergies.
  - ▶ BASOPHILS → will increase in allergies and malignancies.
  - ▶ MONOCYTES → will increase in chronic infections.
  - ▶ LYMPHOCYTE → will increase in acute viral infections and malignancies.
- 
- 

# Thank you!
