

## Cardiovascular Physiology

# Arterial Blood Pressure

**Dr. Abeer A. Al-Masri, PhD**

*A. Professor,*

*Consultant Cardiovascular Physiologist,*

*Faculty of Medicine, KSU.*

# Lecture Outcomes

Concept of mean blood pressure, systolic, diastolic, & pulse pressure.

Normal variations in arterial blood pressure.

Factors determined blood pressure.

Calculation of mean blood pressure.

Relationship between CO, BP & total peripheral resistance.

# What is meant by Arterial Blood Pressure?

- = Lateral pressure created by the heart as it pumps blood, against any unit area of the vessel wall.

**In normal adult  $\approx$  120/80 mmHg**

- Top number (Systolic):**  
= Pressure while the heart is beating.
- Bottom number (Diastolic):**  
= Pressure while the heart is relaxing.

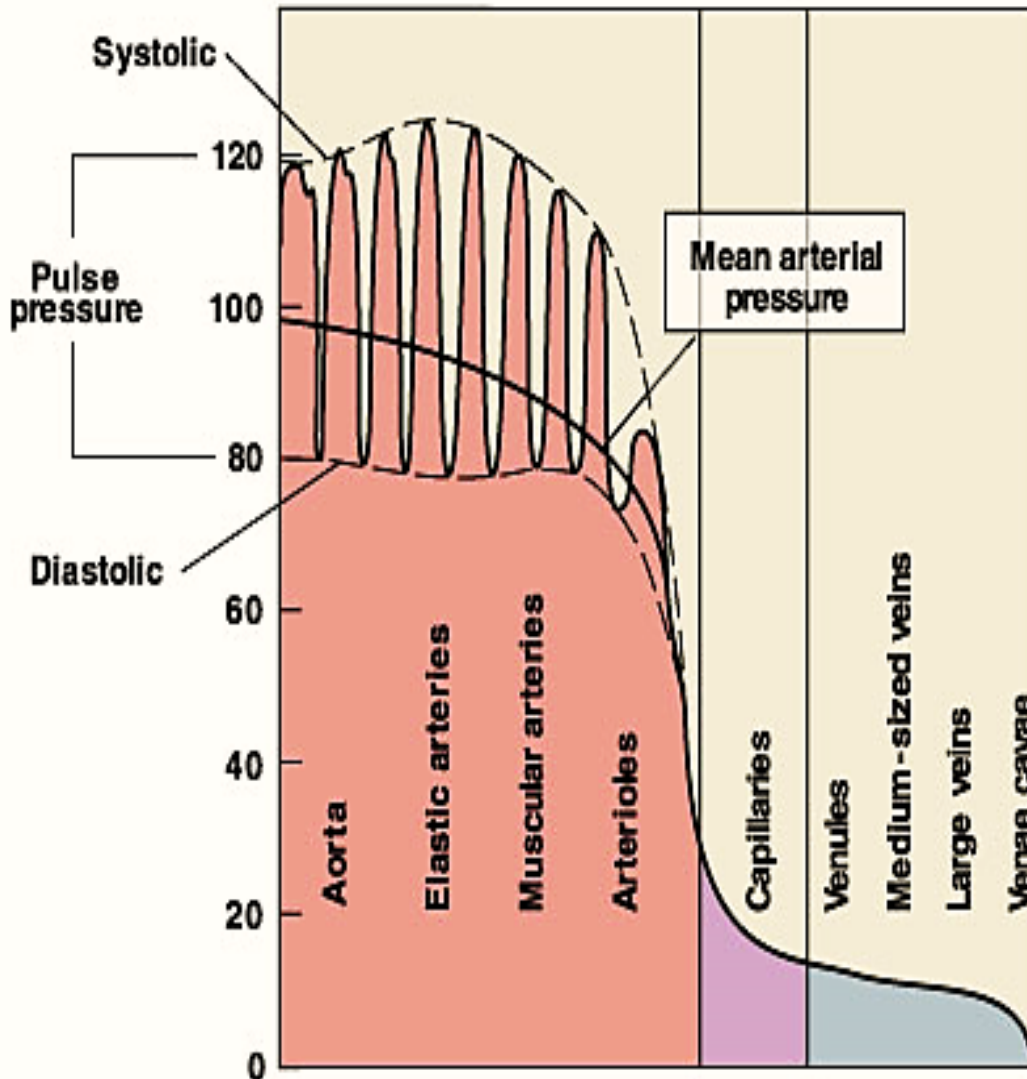

Blood pressure is the measurement of force applied to artery walls

# Pressure changes throughout the systemic circulation

# Pressure changes throughout the systemic circulation

- ❑ Blood flows down a pressure gradient.
- ❑ Highest at the heart.
- ❑ ↓ over distance.
- ❑ ↓ 90% from aorta to vena cava.
- ❑ Greatest drop in pressure occurs in arterioles.
- ❑ No large fluctuations in capillaries & veins.
- ❑ BP averages **120 mm Hg** in aorta & drops to **0-2 mm Hg** in RA.

# Variations in Arterial Blood Pressure

- ❑ **Aortic pressure:**
  - 120 mmHg systolic.
  - 80 mmHg diastolic.
  
- ❑ **Normal arterial pressure:**
  - 110 – 130 mmHg systolic.
  - 70 – 85 mmHg diastolic.

Systolic pressure

**Aortic pressure changes ...  
120/80**

120

Aortic valve closure

**Mean Pressure = diastolic P + 1/3 (systolic P - diastolic P)**

Mean pressure

80

Diastolic pressure

Pressure (mmHg)

**Pulse pressure = Systolic P - Diastolic P**

Time

# American Heart Association Recommended Blood Pressure Levels

**Adult BP range 110 – 130 / 70 – 85 mmHg**

BP Category	Systolic (mmHg)		Diastolic (mmHg)	Follow-up
Optimal	< 120	&	< 80	Recheck 2 years
Normal	< 130	&	< 85	Recheck 2 years
High Normal (Pre-hypertension)	130-<140	or	85-<90	Recheck 1 year

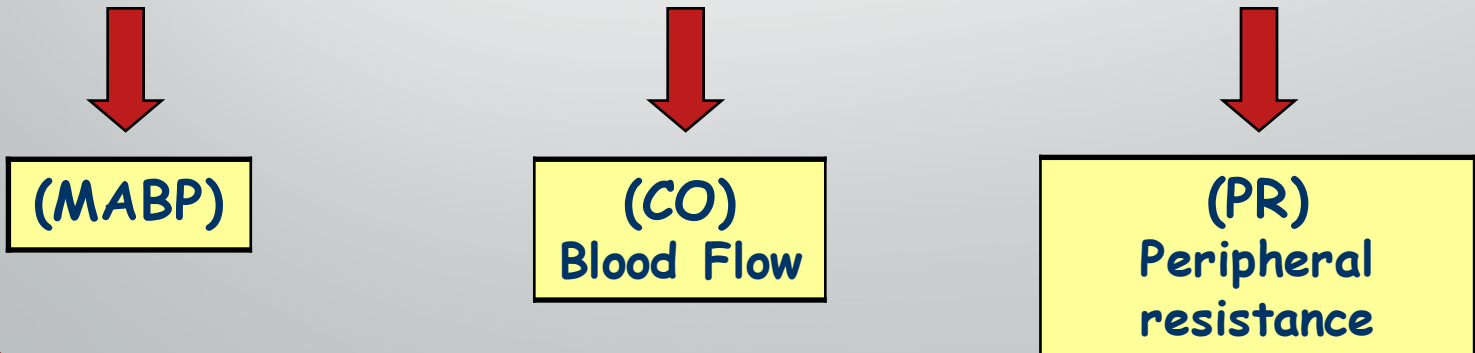

# Factors Affecting ABP

- **Sex:** Male > Female ... (equal @ menopause)
- **Age:** Elderly > children ... (due to atherosclerosis, diabetes, ...)
- **Emotions:** BP (↑) due to neural & hormonal factors.
- **Exercise:** (↑) BP due to ↑ venous return.
- **Hormones:** Some hormones like adrenaline, noradrenaline & thyroid H (↑) BP.
- **Gravity:** BP is higher in lower limbs than upper limbs.
- **Race:** (? dietary factors, or stress)
- **Sleep:** BP (↓) due to ↓ venous return.
- **Pregnancy:** BP (↑) due to ↑ in metabolism.
- **Temperature:** BP (↓) with Heat due to vasodilatation, & (↑) with Cold due to vasoconstriction.

# Factors Determining ABP

- Cardiac output (Flow.)
- Peripheral Resistance.
- Blood volume.

**Blood Pressure = Cardiac Output X Peripheral Resistance**

# Cardiac Output (CO)

- Cardiac output (CO) is the amount of blood pumped by ventricles per minute.
- Factors determining CO:
  1. Stroke volume
  2. Heart rate

**Cardiac Output = Stroke Volume X Heart Rate**

# Blood Flow

- ❑ Amount of blood moving through a vessel in a given time period.
- ❑ Generally is equal to Cardiac output (CO.)
- ❑ Affected by: pressure & resistance.

$$Q = \frac{\Delta P}{R}$$

- ❑ Directly proportional to pressure differences.
- ❑ Inversely proportional to **resistance**.

# Resistance (R)

= tendency of vascular system to oppose flow.

$$\text{Flow} = \frac{1}{R}$$

Influenced by:

Length of the tube (**L**), radius of the tube (**r**), & viscosity of the blood (**η**)

- ❑ In a normal human, length of the system is fixed, so blood viscosity & radius of the blood vessels have the largest effects on resistance..

**Poiseuille's Law**

$$R = 8\eta L / \pi r^4$$

## Poiseuille's Law

- Fluid Flow (Q) through Cylindrical Tubes.
- Flow decreases (↓) when resistance increases.
- Flow resistance decreases (↓) when vessel diameter increases.

$$Q = \frac{(P_i - P_o) \pi r^4}{8\eta L}$$

The diagram illustrates the components of Poiseuille's Law equation. Arrows point from the terms in the equation to colored boxes:  $(P_i - P_o)$  points to a pink box labeled "Difference in Pressure",  $\pi$  points to an orange box labeled "Viscosity",  $r^4$  points to an orange box labeled "Length", and  $8$  points to a yellow box labeled "Radius".

# Total Peripheral Resistance (TPR)

$$R = \frac{\Delta P}{Q}$$

## Systemic Circulation:

$$TPR = \frac{\text{Aortic Pressure} - \text{RAP}}{\text{Flow}}$$

$$TPR = \frac{120 - 2 \text{ mmHg}}{83.3 \text{ ml/sec (5 L/min)}}$$

$$TPR = 1.2 \text{ (PRU's)}$$

## Pulmonary Circulation:

$$\text{Pul. R.} = \frac{\text{Pulmonary Art. P.} - \text{LAP}}{\text{Flow}}$$

$$\text{Pul. R.} = \frac{15 - 3 \text{ mmHg}}{83.3 \text{ ml/sec (5 L/min)}}$$

$$\text{Pul. R.} = 0.12 \text{ (PRU's)}$$

# Blood Flow and Pressure

**P directly proportional to F**

- Blood flows down a pressure gradient.
- Absolute value of pressure is not important to flow, but the difference in pressure (DP or gradient) is important to determining flow.

Higher P ————— Flow —————> Lower P

**P = Pressure**  
**DP = Pressure gradient**

What happens to pressure if we decrease the fluid volume? As in ventricles during systole

Resulting pressure is called the **driving pressure** in vascular system

## How does the flow differ in these two vessels?

# Resistance to Flow in the Cardiovascular System

## Basic Concepts

**$R_t = R_1 + R_2 + R_3$  .... Series Resistance**

**$1/R_t = 1/R_1 + 1/R_2 + 1/R_3$  .... Parallel Resistance**

## What Really Happens in the CVS?

Lower R

Higher R

Lower R

# Resistance to Flow in the Cardiovascular System

If:  $R_1 = 2$ ;  $R_2 = 4$ ;  $R_3 = 6$  Peripheral Resistance Units (PRU's)

□ **Series arrangement gives:**

$$R_T = R_1 + R_2 + R_3$$

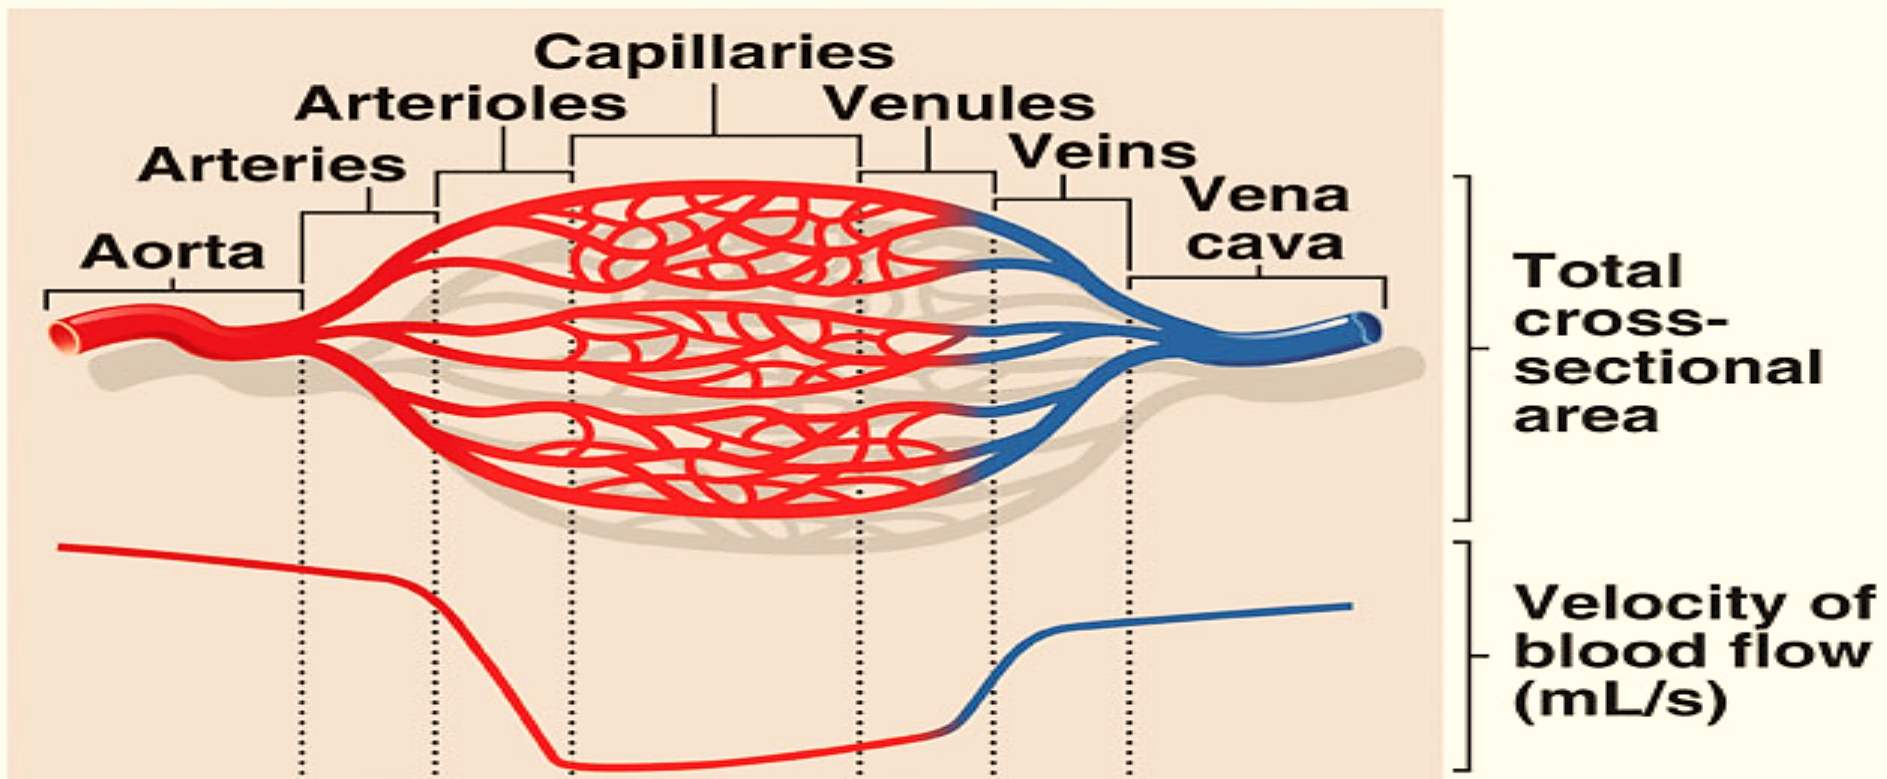

$$R_T = 12 \text{ (PRU's)}$$

□ **Parallel arrangement gives:**

$$R_T = \frac{1}{\frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}} = 1.94 \text{ (PRU's)}$$

# Cross-Sectional Area

As diameter of vessels ↓, the total cross-sectional area  
↑ & velocity of blood flow ↓

# Velocity and Cross Sectional Area

$$A = 2\text{cm}^2$$

$$10\text{cm}^2$$

$$1\text{cm}^2$$

$$Q = 10\text{ml/s}$$

**a**

**b**

**c**

$$V = 5\text{cm/s}$$

$$1\text{cm/s}$$

$$10\text{cm/s}$$

$$V = Q / A$$

# Effect of Radius on Pressure

# Compliance of Blood Vessels

- ❑ **Compliance = distensibility.**
- ❑ Compliance is the volume of blood that the vessel can hold at a given pressure.

$$C = \frac{V}{P}$$

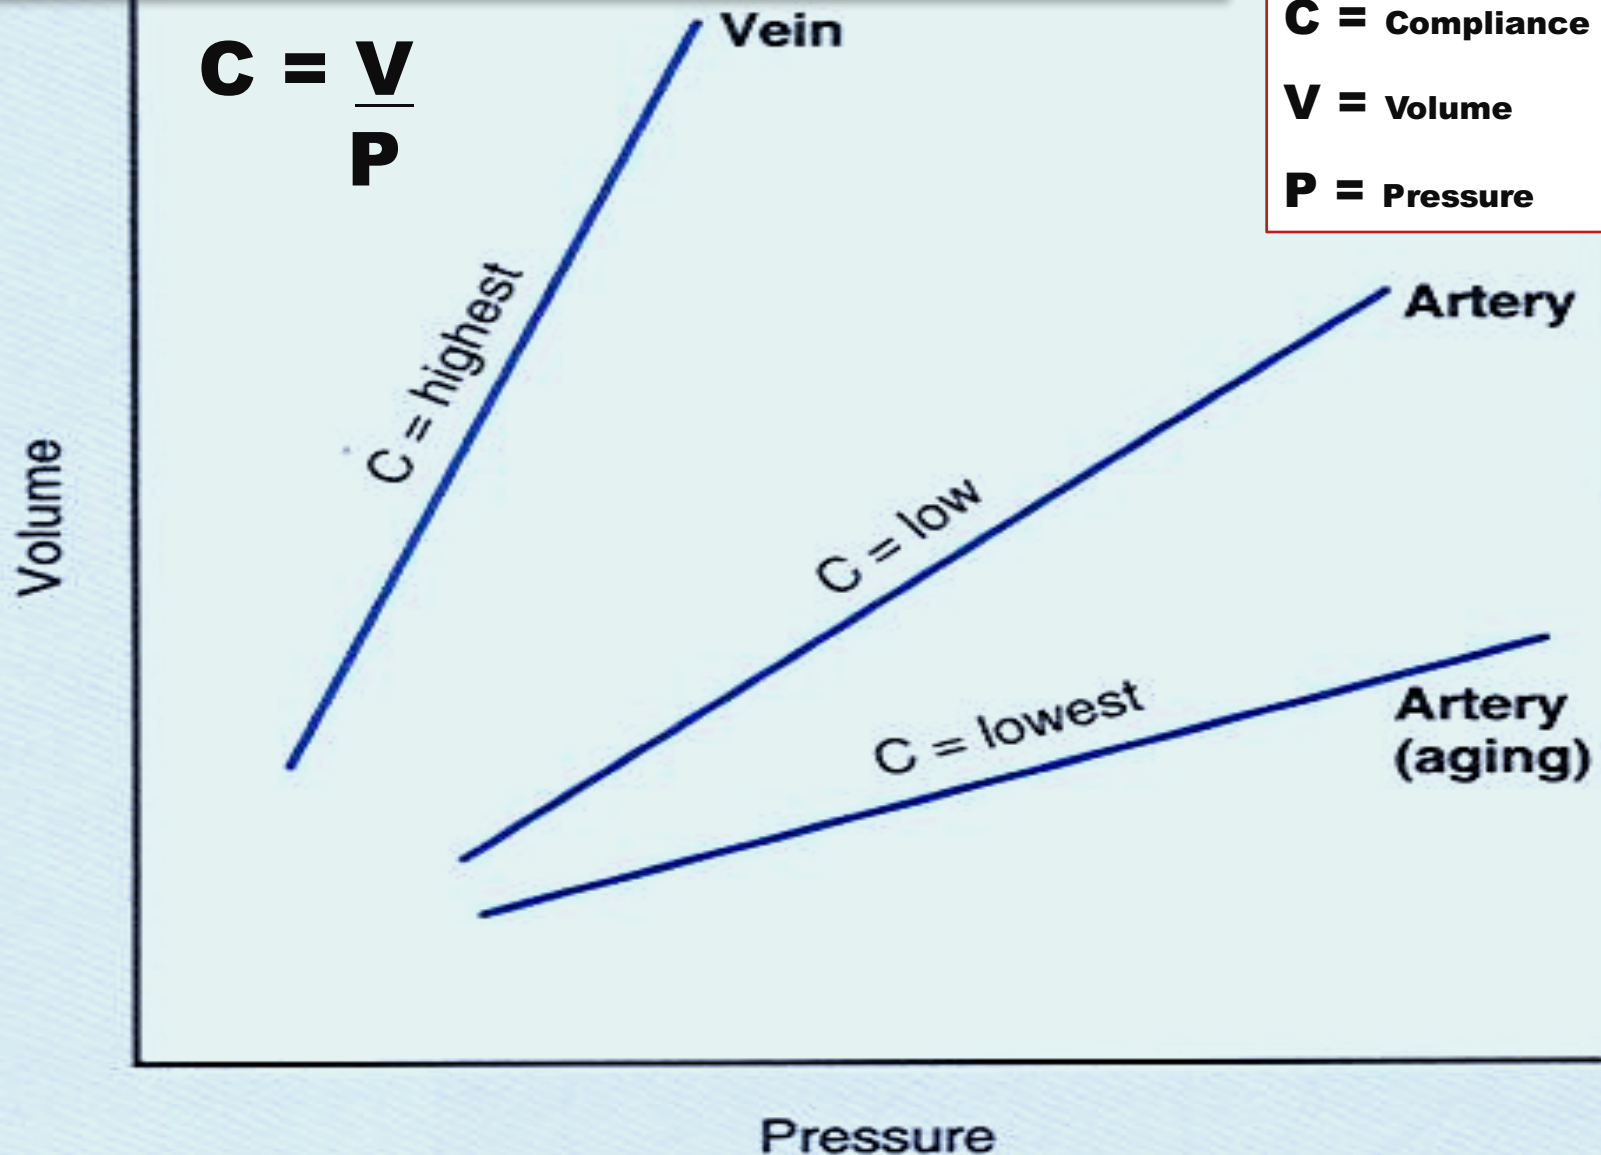

Venous system has a large compliance & acts as a blood reservoir (high volume & low pressure)

$$C = \frac{V}{P}$$

**C** = Compliance

**V** = Volume

**P** = Pressure

# Vascular system possesses different mechanisms for promoting continuous flow of blood to the capillaries:

Elastic recoil

Smooth m. regulation of diameter

Sphincters

Valves

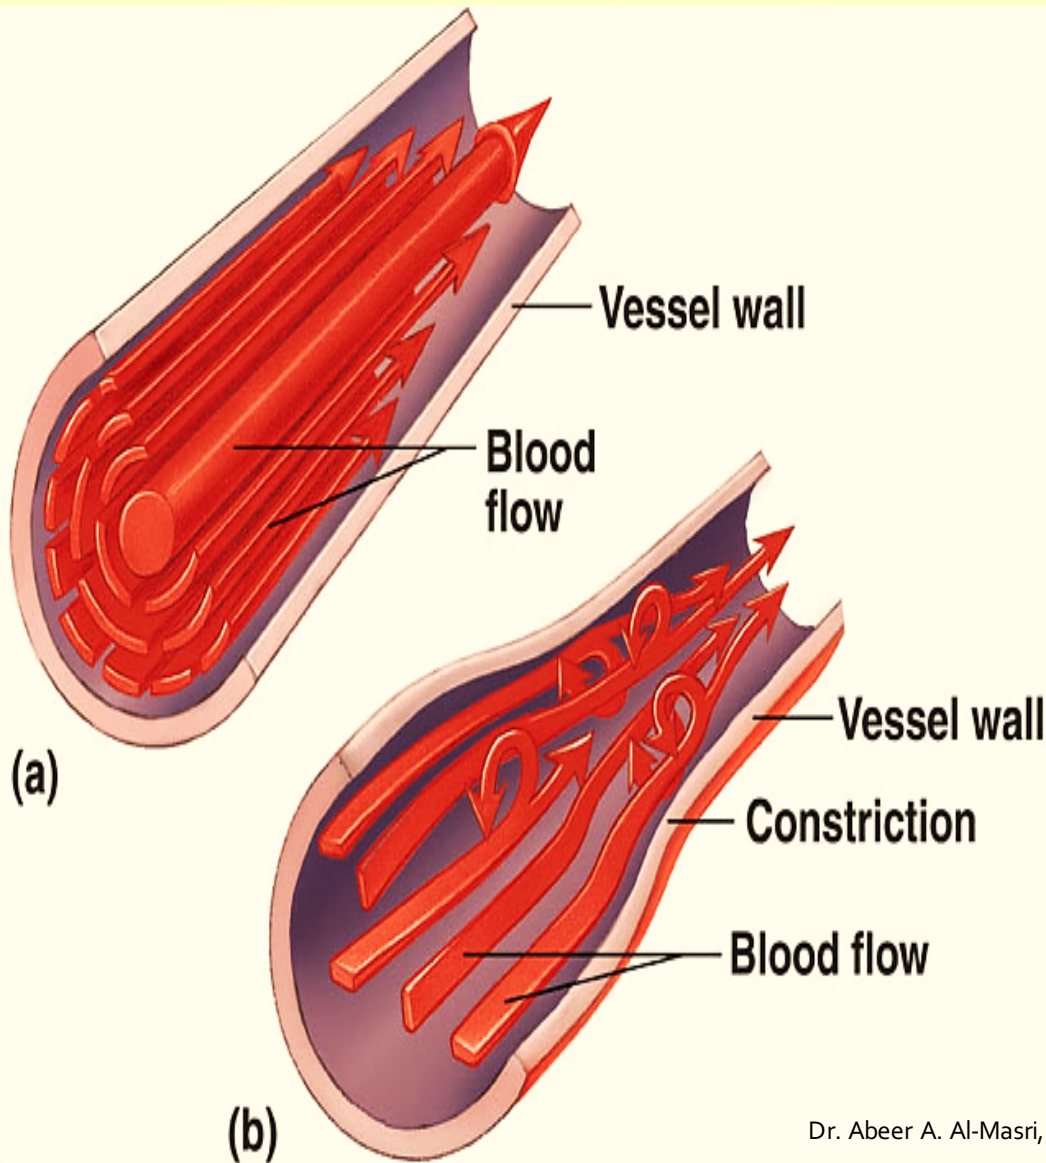

# Measurement of Arterial Blood Pressure

- ❑ Two methods: Direct & indirect
- ❑ **Sphygmomanometer:**
  - Indirect method, "Estimate of pressure"
  - **Many types:**
    - ✓ Mercury sphygmomanometer
    - ✓ Aneroid equipment
    - ✓ Automatic equipment
  - **Blood Pressure Cuff Size:**
    - ✓ Small – children & small adults
    - ✓ Average
    - ✓ Large – overweight & large adults

# Laminar and Turbulent Flow

## □ Laminar flow

- Stream-lined
- Outermost layer moving slowest & center moving fastest

## □ Turbulent flow

- Interrupted
- Fluid passes a constriction, sharp turn, rough surface
- Rate of flow exceeds critical velocity

# Blood Pressure (BP): Measurements

BP is measured by listening for **Korotkoff sounds** produced by turbulent flow in arteries:

- **Systolic pressure**  
= when 1<sup>st</sup> sound is heard.
- **Diastolic pressure**  
= when last sound is heard.

# Blood Pressure (BP): Measurements

# Measuring Blood Pressure Turbulent Flow

1. Cuff pressure  $>$  systolic blood pressure.. **No sound**
2. The **first sound** is heard at peak systolic pressure.
3. **Sounds** are heard while cuff pressure  $<$  blood pressure.
4. **Sound disappears** when cuff pressure  $<$  diastolic pressure.

*Thank You*
