## ECG BASICS

## OUTLINE

1. Review of the conduction system
2. ECG waveforms and intervals
3. ECG leads
4. Determining heart rate
5. Determining heart axis
6. Determining heart rhythm

## THE NORMAL CONDUCTION SYSTEM

## WHAT IS AN ECG?

The electrocardiogram (ECG) is a representation of the sum of all the electrical events of the cardiac cycle.

Each event has a distinctive waveform, the study of which can lead to greater insight into a patient's cardiac pathophysiology.

## WHAT TYPES OF INFORMATION CAN WE OBTAIN FROM AN ECG?

- Heart rate
- Heart Rhythem
- Myopathies
- Electrolyte disturbances (i.e. hyperkalemia, hypokalemia)
- Drug toxicity (i.e. digoxin and drugs which prolong the QT interval)

## WAVEFORMS AND INTERVALS

## WAVEFORMS AND INTERVALS

| VERTICAL AXIS | 1 Small Square $=1 \mathrm{~mm}(0.1 \mathrm{mV})$ |
| :---: | :---: |
|  | 1 Large Square $=5 \mathrm{~mm}(0.5 \mathrm{mV})$ |
|  | 2 Large Squares $=1 \mathrm{mV}$ |

| HORIZONTAL | 1 Small Square $=.04 \mathrm{sec}(40 \mathrm{~m} \mathrm{sec})$ |
| :---: | :--- |
| AXIS | I Large Square $=.2 \mathrm{sec}(200 \mathrm{~m} \mathrm{sec})$ |
|  | 5 Large Squares $=1 \mathrm{sec}(1000 \mathrm{~m} \mathrm{sec})$ |

## ECG LEADS

Leads are electrodes which measure the difference in electrical potential between either:

1. Two different points on the body (bipolar leads)
2. One point on the body and a virtual reference point with zero electrical potential, located in the center of the heart (unipolar leads)

## ECG LEADS

The standard ECG has 12 leads:
3 Standard Limb Leads
3 Augmented Limb Leads 6 Precordial (chest) Leads

The axis of a particular lead represents the viewpoint from which it looks at the heart.

## STANDARD LIMB LEADS

## PRECORDIAL LEADS

## SUMMARY OF LEADS

|  | Limb Leads | Precordial Leads |
| :---: | :---: | :---: |
| Bipolar | I, II, III <br> (standard limb leads) | - |
| Unipolar <br> (V leads) | aVR, aVL, aVF <br> (augmented limb leads) | $\mathrm{V}_{1}-\mathrm{V}_{6}$ |

## CALIBRATION OF ECG PAPER

 E- -1. Q $-1-1-1-1-1+$ E- $-7+\square=\square$ -at $-1+\square$

 - $-\quad-\quad \square$ - $-\infty+\infty$ -w-
 H1 - + - $-1+\square$ $\square \square-\infty-\infty$ H- $\square=-1$

 \# $+\quad+$

## DETERMINING THE HEART RATE

Take the number of "smallest boxes moved by the machine per minute" i.e. (1500), and divide by the number of boxes between adjacent "R"-"R" waves.

$$
\text { H.R. = } 1500 \text { / \# of squares b/w } 2 \text { " } R \text { - } R \text { " waves }
$$

## RULE OF 1500

Take the number of "smallest boxes moved by the machine per minute" i.e. (1500) , and divide by the number of boxes between adjacent "R"-"R" waves.

## H.R. = 1500 / \# of squares b/w 2 "R - R" waves

## WHAT IS THE HEART RATE?

$$
(1500 / 30)=50 \mathrm{bpm}
$$

## WHAT IS THE HEART RATE?

$(1500 / \sim 18)=\sim 83$ bpm

## WHAT IS THE HEART RATE?

$(1500 / 8)=187$ bpm

## THE RULE OF 1500

It may be easiest to memorize the following table:

| \# of big <br> boxes | Rate |
| :---: | :---: |
| 1 | 300 |
| 2 | 150 |
| 3 | 100 |
| 4 | 75 |
| 5 | 60 |

## THE RULE OF 1500

## RHYTHM

The Rhythem is defined as the time interrelationship between 2 (adjacent) "R" waves.

The rhythm of the heart can be regular or irregular.

## AXIS (Rule of the thumb)

## Leads I and III are used (but I and AVf can also be used )

- Both +ve (Normal axis)
- I +ve and III -ve (Left axis deviation)
- I -ve and III +ve (Right axis deviation)

## THANK YOU
