***Pharmacokinetics I***  
***Drug administration and absorption***

---

**Prof. Hanan Hagar**  
**Pharmacology Department**

***By the end of this lecture, the student should be able to***

- **Know the meaning of pharmacology and its branches.**
  - **Discuss the different routes of drug administration**
  - **Identify the advantages and disadvantages of various routes of drug administration**
  - **Know the various mechanisms of drug absorption**
  - **List different factors affecting drug absorption**
  - **Define bioavailability and factors affecting it.**
-

---

# Recommended books

- **Lippincott's illustrated reviews  
(Pharmacology) *by Howland and Mycek***
  - **Basic and Clinical Pharmacology *by  
Katzung***
-

# **Pharmacology**

**Pharma : drug**

**Logos: Science**

**Pharmacology** is the science that deals with the drugs regarding names, pharmacokinetics, pharmacodynamics, side effects and uses.

---

---

# Pharmacokinetics

are studies of the absorption, distribution, metabolism & excretion of drugs.

(what the body does to a drug?)

# Pharmacodynamics

Are studies of

- Mechanisms of drug action.
- Pharmacological effects of drugs.

(what the drug does to the body?)

---

# Pharmacokinetics of drugs

Are studies of drugs regarding **ADME**

- ❑ **A**bsorption
- ❑ **D**istribution
- ❑ **M**etabolism
- ❑ **E**xcretion

**Drug**

# Pharmacokinetics

**Excretion**

**Administration**

**Metabolism**

**Blood**

**Absorption**

**Site of action**

**Distribution**

**Different organs & tissues**

---

# Routes of drug administration

- **Enteral via gastrointestinal tract (GIT).**
    - *Oral*
    - *Sublingual*
    - *Rectal*
  - **Parenteral administration = injections.**
  - **Topical application**
  - **Inhalation**
-

# Oral administration

**Advantages:** Common, easy, self use, convenient, cheap, no need for sterilization

## **Disadvantages**

- Slow effect, GIT irritation
- Destruction by pH & enzymes e.g. penicillin, insulin
- Food -drug or drug-drug interactions
- First pass effect
- No complete absorption
- Low bioavailability

***Not suitable*** for

- ❑ vomiting & unconscious patient
- ❑ emergency & bad taste drugs

# Oral administration

<b>Advantages</b>	<b>Disadvantages</b>
<ul style="list-style-type: none"><li>- <b>Common</b></li><li>- <b>Easy</b></li><li>- <b>Self use</b></li><li>- <b>convenient</b></li><li>- <b>cheap</b></li><li>- <b>No need for sterilization</b></li></ul>	<ul style="list-style-type: none"><li>- <b>Slow effect, GIT irritation</b></li><li>- <b>Destruction by pH &amp; enzymes</b></li><li>- <b>Food - drug interactions</b></li><li>- <b>Drug-drug interactions</b></li><li>- <b>First pass effect</b></li><li>- <b>No complete absorption</b></li><li>- <b>Low bioavailability</b></li></ul> <p><b><i>Not suitable</i></b> for</p> <ul style="list-style-type: none"><li>❑ <b>vomiting &amp; unconscious patient</b></li><li>❑ <b>emergency &amp; bad taste drugs</b></li></ul>

# Bioavailability

- Is the amount of unchanged drug that enters systemic circulation after administration and becomes available to produce pharmacological actions
-

## First pass effect

- Drugs given orally are first taken to the liver (via portal circulation), where they are metabolized before reaching to the blood to be distributed to all other body compartments.

---

# First pass Metabolism

## Where does it occur?

- **Liver**
- **GIT wall**
- **GIT lumen**

## First pass metabolism results in:

- **Low bioavailability** (low conc. of drug in blood).
  - **Short duration of action** ( $t_{1/2}$ ).
  - **drugs with high first pass effect should not be given orally but parenterally.**
-

---

# Oral Dosage Forms (oral formulations)

## ■ Tablets

- **Coated tablets:** sugar-coated to mask bad taste
- **Enteric coated tablets:** dissolve only in **intestine**

## ■ Capsules

- **Hard gelatin capsules:** (contain powder)
- **Soft gelatin capsules:** (contain liquid)

## ■ Syrup (e.g. Cough syrups)

## ■ Suspension (mixture of solid in liquids e.g. antibiotics).

---

# Tablets

# Hard- gelatin capsule

# Spansule

# Soft- gelatin capsule

# Sublingual

## Advantages

- ❑ **Rapid effect**
- ❑ **can be used in emergency**
- ❑ **High bioavailability**
- ❑ **No first pass effect.**
- ❑ **No GIT irritation**
- ❑ **No food drug – interaction**
- ❑ ***Dosage form:* friable tablet**

## Disadvantages

***not suitable  
for***

**Irritant drugs**

**Frequent use**

# Rectal administration

## Advantages

### *Suitable for*

- ❑ children, vomiting, unconscious patients
- ❑ Irritant & bad taste drugs
- ❑ less first pass metabolism (50%)
- ❑ *Dosage form:*  
suppository or enema

## Disadvantages

- ❑ Irritation of rectal mucosa
- ❑ Irregular absorption & bioavailability

# Parenteral administration

**Intradermal (I.D.) (into skin)**

**Subcutaneous (S.C.) (under skin)**

**Intramuscular (I.M.) (into muscles)**

**Intravenous (I.V.) (into veins)**

**Intra-arterial (I.A.) (into arteries)**

**Intrathecal (I.T.) (cerebrospinal fluids )**

**Intraperitoneal (I.P.) (peritoneal cavity)**

**Intra - articular (Synovial fluids)**

# Parenteral administration

## Advantages of injections

- ❑ No gastric irritation
- ❑ No food-drug interaction
- ❑ No drug-drug interaction
- ❑ No first pass metabolism
- ❑ higher availability than oral

## Disadvantages

- ❑ Need skill
- ❑ Pain, tissue necrosis or abscess (I.M.)
- ❑ Anaphylactic or hypersensitivity reaction (I.V.)

## Intradermal administration

- Minute volume of drug (0.1 ml)
- suitable for vaccinations
- sensitivity test

***not suitable***  
**for large**  
**volumes**

## Subcutaneous administration

- volume of drug (0.1 ml – 1 ml)
- used for sustained release effect
- suitable for poorly soluble suspensions e.g. insulin zinc preparation

***Not suitable***  
**for large**  
**volumes**

## Intramuscular administration

- moderate volumes (3-5 ml)
- prolonged duration of action
- oily preparations or poorly soluble substances can be used

***Not suitable for***

- irritant drugs
- pain, abscess, tissue necrosis may happen

# Intravenous administration

<b>Advantages</b>	<b>Disadvantages</b>
<ul style="list-style-type: none"><li>❑ Large volume (500ml can be given by infusion)</li><li>❑ Rapid action (<u>emergency</u>)</li><li>❑ High bioavailability</li><li>❑ No food-drug interaction</li><li>❑ No first pass metabolism</li><li>❑ No gastric irritation</li></ul> <p><b><i>Suitable for</i></b></p> <ul style="list-style-type: none"><li>❑ Vomiting &amp; unconscious</li><li>❑ Irritant &amp; bad taste drugs.</li></ul>	<ul style="list-style-type: none"><li>❑ used only for water soluble drugs</li><li>❑ Infection</li><li>❑ Anaphylaxis</li><li>❑ Sterilization</li><li>❑ Expensive</li></ul> <p><b><i>Not suitable</i></b> for oily solutions or poorly soluble substance</p>

---

# Ampoule

Single use

# Vial

Repeated use

<b>Injection</b>	<b>Advantages</b>	<b>Disadvantages</b>
<b>I.D.</b>	minute volume (0.1 ml) suitable for vaccinations & sensitivity test	not suitable for large volumes
<b>S.C.</b>	Volume (0.1 ml – 1 ml ) suitable for poorly soluble suspensions and for instillation of slow-release implants e.g. insulin zinc preparation	not suitable for large volumes
<b>I.M.</b>	Suitable for moderate volumes 3-5 ml, for oily solutions or poorly soluble substances	not suitable for irritant drugs Abscess- necrosis may happen
<b>I.V.</b>	suitable for large volumes and for irritating substances (500 ml can be given by infusion).	not suitable for oily solutions or poorly soluble substances Must inject solutions slowly as a rule

---

# Topical application

- **Drugs are mainly applied topically to produce local effects. They are applied to**
  - **Skin (**percutaneous**) e.g. allergy test, topical antibacterial and steroids and local anesthetics.**
  - **Mucous membrane of respiratory tract (**Inhalation**) e.g. asthma**
  - **Eye drops e.g. conjunctivitis**
  - **Ear drops e.g. otitis externa**
  - **Intranasal e.g. decongestant nasal spray**
-

# Inhalation

## Advantages

- rapid absorption  
*(due to large surface area)*
- suitable for emergency
- provide local action
- limited systemic effect
- less side effects
- no first pass effect

### *Dosage form:*

- volatile gases e.g. anesthetics
- liquids given by aerosol, nebulizer for asthma treatment

## Disadvantages

**Not suitable for irritant drugs**

**Only few drugs can be used**

# Transdermal patch

are medicated adhesive patch applied to skin to provide systemic effect (prolonged drug action).

e.g. the nicotine patches (**quit smoking**).

e.g. Scopolamine (**vestibular depressant, antiemetic for motion sickness**).

# Nebulizer

# Atomizer

# Drug absorption

Is the passage of drug from its site of administration to site of action across cell membranes.

---

# Drug absorption

- ❖ Except for intravenous administration, all routes of drug administration require that the drug be absorbed from the site of administration into the systemic circulation (blood).
  - ❖ **I.V. administration requires no absorption**
-

## Sites of Administration

## Absorption & distribution

## Elimination

---

# Mechanisms of drug absorption

- The transport of drugs across cell membrane occurs through one or more of the following processes:
    1. **Simple diffusion = passive diffusion.**
    2. **Active transport.**
    3. **Facilitated diffusion.**
    4. **Pinocytosis (Endocytosis).**
-

# Cell membrane

# Cell Membrane

---

# Types of passive diffusion

- **Aqueous diffusion:** low molecular weight and water soluble drugs can diffuse through aqueous channels or pores in cell membrane (**filtration**).
  - **Lipid diffusion:** low molecular weight and lipid soluble drugs are absorbed via diffusion through lipid cell membrane itself.
-

# Simple diffusion

**Passive diffusion of a water-soluble drug through an aqueous channel or pore.**

**Passive diffusion of a lipid-soluble drug dissolved in a membrane.**

**Carrier-mediated active transport of drug**

---

# Simple diffusion

## Characters

- **Common.**
  - **Occurs with or along concentration gradient.**
  - **No energy**
  - **No carrier**
  - **Non selective**
  - **Not saturable**
  - **depends on lipid solubility.**
  - **depends on pka of drug - pH of the environment (it can be fluid of the cell body, blood, urine).**
-

# Simple diffusion

High conc

Low conc

---

# pH Effect

- Most drugs are weak acids or weak bases.
  - Drugs can exist in two forms ionized (water soluble) & unionized forms (lipid soluble) in equilibrium.
  - Only **unionized form** is absorbable.
  - Ionization of drugs reduce passage of drugs across cell membranes.
  - The degree of ionization of drugs is determined by their pKa and pH of the surrounding.
-

---

# Remember

- **Water soluble drugs = ionized = polar = charged are difficult to permeate cell membranes.**
  - **Lipid soluble drugs = unionized = non polar = uncharged are easy to permeate cell membranes**
-

---

# pH Effect

## Affects degree of ionization of drugs.

- **Weak acidic drugs** → best absorbed in stomach (in acidic medium of stomach, drug exists in unionized form that is lipid soluble and easily absorbed).
  
  - **Weak basic drugs** → best absorbed in intestine. (in basic medium of intestine, drug exists in unionized form that is lipid soluble and easily absorbed).
-

---

# **pKa of the drug**

**(Dissociation or ionization constant): pH at which half of the substance is ionized & half is unionized.**

- The lower the pKa value ( $pK_a < 6$ ) of the acidic drug, the stronger the acid e.g aspirin (Pka= 3.0).
  - The higher the pKa value ( $pK_a > 8$ ) of a basic drug, the stronger the base e.g propranolol ( pKa= 9.4)
-

---

*Which one of the following drugs will be best absorbed in stomach where pH is around = (1-2)?*

**Aspirin**                      **pka=3.0**

**Propranolol**                **pka= 9.4**

---

# Active Transport

- relatively uncommon.
  - occurs against concentration gradient.
  - requires carrier and energy.
  - specific or selective
  - saturable
- e.g.
- absorption of sugar, amino acids.
  - uptake of levodopa by brain.
  - Levodopa is used in treatment of parkinsonism
-

## PASSIVE TRANSPORT

## ACTIVE TRANSPORT

# Carrier-mediated Facilitated Diffusion

- occurs along concentration gradient
- No energy is required
- requires carriers
- selective
- Saturable
- Similar to entry of glucose into muscle (GLUT 4).

# Facilitated Diffusion

---

# Phagocytosis (Endocytosis & Exocytosis)

## Endocytosis:

uptake of membrane-bound particles.

## Exocytosis:

expulsion of membrane-bound particles

**Phagocytosis occurs for drugs which are either**

- high molecular weight drugs
    - large molecules such as **peptides**
  - high polar drugs, such as vitamin B12 & iron
    - vitamin B12 combines with intrinsic factor.
    - iron combines with transferrin.
-

# (Endocytosis)

# (Exocytosis)

# Mechanisms of drug absorption

## Factors affecting absorption :

- Route of administration.
- Dosage forms (depending on particle size and disintegration, ease of dissolution).

**(solution > suspension > capsule > tablet)**

---

- Molecular weight of drug.
- Lipid solubility
- Degree of ionization
- Drug solubility (aqueous preparation better than oily, suspension preparations)
- Chemical instability in gastric pH

**(Penicillin & insulin )**

---

## Factors affecting absorption :

- **Surface area available for absorption.**
    - ❑ small intestine has large surface area than stomach due to intestinal microvilli.
  - **Blood flow to absorptive site**
    - **greater** blood flow increases bioavailability
    - Intestine has greater blood flow than stomach
  - **Intestinal motility (transit time)**
    - Diarrhea reduce absorption
-

## ➤ Gastric emptying

- drugs that increase gastric emptying enhances absorption (metoclopramide).

## ➤ Drug interactions

## ➤ Food

- **slow** gastric emptying
  - generally slow absorption
  - Tetracycline, aspirin, penicillin V
  - A **fatty meal** increase the absorption of fat soluble antifungal drug (e.g. griseofulvin)
-

## **Passive transport**

**along concentration  
gradient**

**(From high to low)**

**No carriers**

**Not saturable**

**Not selective**

**No energy**

## **Active transport**

**against concentration  
gradient**

**(From low to high)**

**Needs carriers**

**saturable**

**Selective**

**energy is required**

<b>Active transport</b>	<b>Carrier-mediated facilitated diffusion</b>
<b>Against concentration gradient</b> <b>(From low to high)</b>	<b>along concentration gradient</b> <b>(From high to low)</b>
<b>Needs carriers</b>	<b>Needs carriers</b>
<b>saturable</b>	<b>Saturable</b>
<b>Selective</b>	<b>Selective</b>
<b>Energy is required</b>	<b>No energy is required</b>

# Summary

- Different routes of administration are available
- Parenteral administration is the suitable route to provide rapid effect.
- **I.V.** is used in emergency and provide high availability
- Oral administration is best avoided during emergency or when severe first pass metabolism may occur
- Drugs may cross any cell membrane by simple diffusion, active transport, facilitated diffusion, and pinocytosis.

# Questions?
