

Prof. Mohammad Alhumayyd Dr. Aliah

**Pharmacology Department** 

# Objectives of the Lecture

- Classification of antibiotics
- Misuses of antibiotics
- Choice of antibiotics
- Bacterial resistance and ways to prevent it
- General principles of antibiotic therapy
- Indications for antibiotics prophylaxis.

# What is Antibiotic?

Alexander Fleming (1881-1955)

Colonies of Staphylococcus aureus

Howard Florey (1898-1968)

Ernst Boris Chain (1906-1979)

Nobel prize in 1945

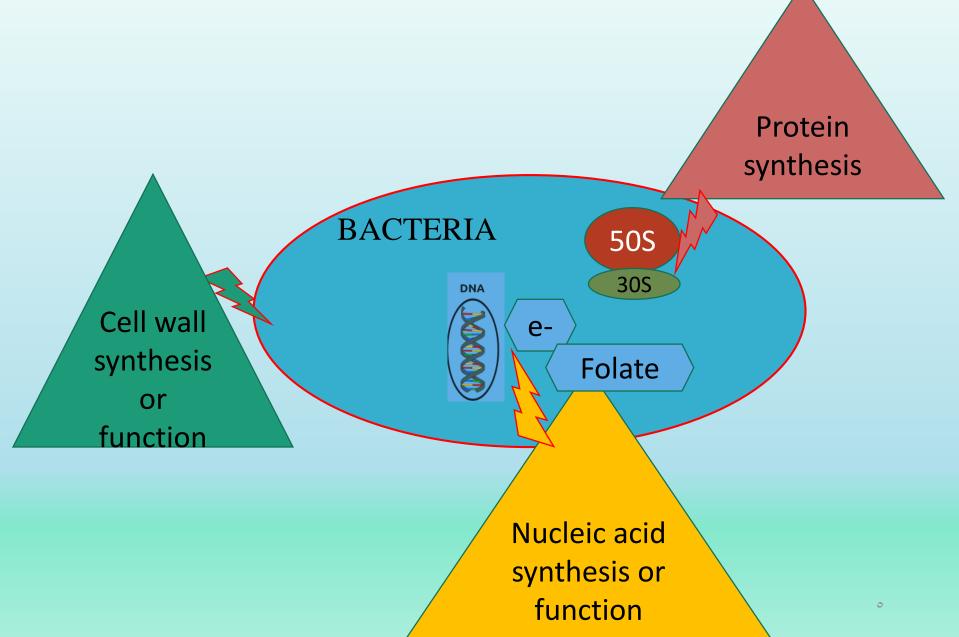

### **Definition of Antibiotics**

Chemical substances produced by various **microorganisms** (bacteria, fungi, actinomycetes) that have the capacity to inhibit the growth or destroy **other microorganisms**.

Nowadays they are chemically synthesized. They either kill bacteria (bactericidal) or hold bacteria from growing (bacteriostatic)

Antibiotics will not cure infections caused by viruses.

Mechanism of action of Antibiotics

# CLASSIFICATION OF ANTIBIOTICS ACCORDING TO MECHANISM OF ACTION

- INHIBITION OF bacterial CELL WALL SYNTHESIS e.g. Penicillins, Cephalosporins
- INHIBITION OF bacterial PROTEIN SYNTHESIS e.g. Macrolides, Tetracyclines
- INHIBITION OF bacterial DNA SYNTHESIS e.g. Quinolones
- INHIBITION OF FOLATE METABOLISM e.g. Sulfonamides, Trimethoprim
- INHIBITION OF RNA synthesis by binding to RNA polymerase e.g. Rifampicin.

# According to spectrum

 Narrow spectrum, e.g.: penicillin G, aminoglycosides

 Broad spectrum, e.g.: ampicillin, amoxicillin

## Choice of Antibiotic

A) Clinical diagnosis (e.g. Syphilis)

B) Microbiological information

C) Pharmacological consideration

# B) Bacteriological informations

#### **Advantages**

- The exact antibiotic to be used
- The most effective and reject the one with little or no activity
- The least toxic
- The cheapest.

#### **B)** Bacteriological informations (Cont')

#### **Disadvantages**

- ☐ The bacteria isolated may not be the prime cause of the disease
- do not take in consideration site of infection
- ☐ some bacteria cannot be cultivated or take time to grow (e.g. M. Leprae, M. Tuberculosis)
- Bacteriological services are not available at all hospitals.

# Choice of Antibiotics (cont')

- C) Pharmacological consideration
- 1. Site of infection
- 2. Host factors
  - a) Immune system e.g. Alcoholism, diabetes, HIV, malnutrition, anticancer drugs, advanced age-(higher than usual doses or longer courses are required)
    - b) Genetic factors
  - e.g. Patients with G-6-PD deficiency treated with sulfonamides (Hemolysis).

#### **Choice of Antibiotics (Cont')**

- c) Pregnancy and Lactation
  - Aminoglycosides (hearing loss)
  - Tetracyclines (bone deformity)
- d) Extreme Age
  - Neonates and elderly
- e) Renal function
  - e.g. Aminoglycosides (renal failure)
- f) Liver function
  - e.g. Erythromycin (hepatic failure)
- 3. Drug Allergy.

## MISUSES OF ANTIBIOTICS

- Treatment of diseases caused by viruses
- Improper dosage
- Therapy of fever of unknown origin
- Presence of pus or necrotic tissues, or blood at the surgical site
- Excessive use of prophylactic antibiotics in travelers
- Lack of adequate bacteriological information
- Overuse as growth promoters in animals & agriculture
- Pts do not take them according to their doctor's instructions
- Some pts save unused antibiotics for another illness, or pass to others.

#### Reasons for MISUSES of ANTIBIOTICS

#### A consequence of many factors:

- 1- Availability of a very wide selection
- 2- Limitation of physician's time
- 3- Physician shortage and expenses
- 4- Availability without Rx in pharmacies
- 3- Public demand (pressure to prescribe).

#### **Bacterial Resistance**

One result of the widespread use of antibiotics has been the emergence of resistant pathogens that have been sensitive in the past

#### **Definition**

Conc of antibiotic required to inhibit or kill the bacteria is greater than the conc that can safely be achieved in the plasma.

# Mechanisms of Acquired Antibiotic Resistance

- 1. Inactivation by enzyme produced by bacteria Bacterial  $\beta$ -lactamase inactivates penicillins & cephalosporins by cleaving the  $\beta$ -lactam ring of the drug
- 2. Bacteria develops an altered receptor for the drug
- 3. Bacteria develops an altered metabolic pathway
- 4. Reduced bacterial permeability to antibiotic
- 5. Actively transporting the drug out of the cell.

## Prevention of Resistance

- \*Use antibiotics only when absolutely required
- \*Use antibiotics in adequate dosage for sufficient period of time

Not too brief therapy

Not too prolonged therapy

(exceptions, e.g. TB)

\*Combination of antibiotics may be required to delay resistance (e.g. TB).

## General Principles of antibacterial therapy

- Administer drug in full dose, at proper interval and by the best route
- When apparent cure achieved, continue antibiotic for about 3 days further to avoid relapse
- Skipping doses may decrease effectiveness of antibiotic & increase the incidence of bacterial resistance.
- In some infections, bacteriological proof of cure is desirable (e.g. TB, UTI)
- Measurement of plasma conc. of antibiotics is seldom needed, except for systemic aminoglycosides (e.g., streptomycin, gentamicin).

#### General Principles of antibacterial therapy (cont')

- ❖ 2 or > antimicrobial drugs should not be used without good reason, e.g.:
- Mixed bacterial (polymicrobial) infections
- Desperately ill patient of unknown etiology
- To prevent emergence of resistance (e.g. TB)
- To achieve synergism
  e.g. piperacillin + gentamicin (p. aeruginosae)

#### Disadvantages of multiple antibiotics

- Increased risk of sensitivity or toxicity
- Increased risk of colonization and infection with a resistant bacteria
- Possibility of antagonism
- Higher cost.

# Indications for antibiotics prophylaxis

#### Surgical prophylaxis, e.g.:

bowel surgery, joint replacement, etc. to prevent postoperative infections

#### Immunosuppressed Patients, e.g.:

Very old, Very young, Diabetics, Anaemics, AIDS, Cancer pts

#### Dental extractions, e.g.:

Pts with total joint replacements

Pts with cardiac abnormalities.
