## Respiratory Block

# 9 Treatment of Respiratory Tract Infections

## Objectives :

At the end of lecture, the students should be able to understand the following:

1. The types of respiratory tract infections (RTI)
2. The antibiotics that are commonly used to treat RTIs & their side effects
3. Understand the mechanism of action & pharmacokinetics of individual drugs.

---

---

Color index:

**Red: important**

Grey: Notes or extra information

# Respiratory Tract Infections

## Respiratory Tract Infections Classification

### Upper Respiratory Tract Infections

### Lower Respiratory Tract Infections (costly & more difficult to treat)

**Viruses;** Most URTIs are of viral etiology.

**Treatment:**

(Should **NOT** be treated with antibiotics)  
Rest & plenty of fluids, OTC cold & pain relievers.

OTC : over the counter, without description like Panadol.

**Bacteria** (mainly Group A streptococcus, H. influenza).

**Treatment:** Antibiotics.

The type depends on:

- Type of bacteria.
- Sensitivity test.

**Bronchitis** (Inflammation of major bronchi & trachea)

Acute, or Chronic, or Acute exacerbation of chronic bronchitis.

**Causes:** Viruses or bacteria (*H. influenza*, *Streptococcus pneumoniae* & *Moraxella catarrhalis*).

**Pneumonia** (Serious infection of bronchioles & alveoli)

- Community -Acquired (CAP).
- Hospital-acquired.

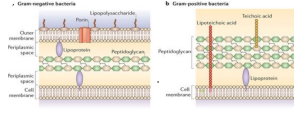

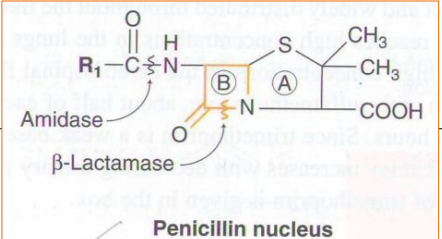

**Causes:** Bacteria

*S.pneumoniae* (66%), *H. influenza* (20%), *M. catarrhalis* (20%).

## Antibiotics commonly used in the treatment of RTIs:

- 1- Beta-lactam antibiotics (Penicillins/ Cephalosporins)
- 2- Macrolides
- 3- Fluoroquinolones
- 4- Aminoglycosides
- 5- Doxycycline

# Penicillins

<b>Broad-spectrum penicillins</b>	<ul style="list-style-type: none"> <li>- <b>Amoxicillin</b>- Clavulanic acid *</li> <li>- <b>Ampicillin</b>- Sulbactam*</li> <li>- <b>Piperacillin</b>-tazobactam *</li> </ul> <p>Act on both gram +ve and gram -ve microorganisms</p>
<b>Mechanism of action</b>	<ul style="list-style-type: none"> <li>- Inhibit bacterial cell wall synthesis → through inhibition of peptidoglycan layer on the cell wall</li> <li>- Bactericidal</li> </ul> <div style="display: flex; align-items: center;">  <div style="margin-left: 20px;">  <p><b>Penicillin nucleus</b></p> </div> </div>
<b>Pharmacokinetics</b>	<ul style="list-style-type: none"> <li>❖ Given po or parenterally</li> <li>❖ Not metabolized in human</li> <li>❖ Relatively lipid insoluble</li> <li>❖ Excreted mostly unchanged in urine</li> <li>❖ Probenecid slows their elimination &amp; prolong their half live</li> <li>❖ Half-life 30-60 min (increased in renal failure)</li> </ul>
<b>Adverse effects</b>	<ul style="list-style-type: none"> <li>● Hypersensitivity reactions</li> <li>● Diarrhea</li> <li>● Superinfections</li> <li>● Nephritis</li> <li>● Convulsions (after <u>high i.v. dose</u> or in <u>renal failure</u>)</li> </ul>
<b>Therapeutic uses</b>	<ul style="list-style-type: none"> <li>● URTIs</li> <li>● LRTIs</li> </ul>

- Bacteria produces beta-lactamase which is an enzyme that cleaves beta-lactam and stops the penicillin from working, so we add beta-lactamase inhibitor to the penicillin. For example: amoxicillin (penicillin) clavulanic acid (beta-lactamase inhibitor)
- Extra: amoxicillin-clavulanic acid commercial name is Augmentin

# Cephalosporins

## Features (MOA):

- Inhibit bacterial cell wall synthesis
- Bactericidal (**similar to Penicillins**)
- Classified into 3 generations:

Generation	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>
Drugs	Cephalexin	Cefuroxime, Cefaclor	Ceftriaxone, Cefotaxime, Cefixime
Route of administration	Orally	Orally Well absorbed	I.V
Spectrum	Gram- <b>positive</b> bacteria	Gram- <b>negative</b> bacteria (Active against $\beta$ -lactamase-producing bacteria)	Gram- <b>negative</b> bacilli
Uses	Effective in URTIs	Upper & lower RTIs	Effective in treatment of pneumonia

## Pharmacokinetics of Cephalosporins

- Cephalosporins are given parenterally & po. "po= orally"
  - Relatively lipid insoluble (**like penicillins**).
  - Don't penetrate cells or the CNS, **except for third generations**. 3rd generation is more lipid soluble
  - Mostly excreted unchanged by the kidney (**glomerular & tubular secretion**).
  - Probenecid slows their elimination & prolong their half lives
- Half-life: 30-90 min; **except ceftriaxone** 4-7 hr.

## Adverse effects of Cephalosporins \*

- Hypersensitivity reactions.
- Thrombophlebitis. Inflammation of the wall of vein
- Superinfections. Because of killing of normal flora
- Diarrhea.

\*Dr. Aliah said: Local irritation can produce pain after IM injection & thrombophlebitis after IV injection.

# Macrolides

## Mechanism of action

- Inhibit bacterial protein synthesis by binding to 50S subunit of the bacterial ribosomal RNA.
- Bacteriostatic.\*\*
- Bactericidal at high concentration.\*\*\*

\*Dr. Aliah said: Erythromycin is the prototype, Clarithromycin & azithromycin are semisynthetic derivatives of erythromycin.

\*\* Bacteriostatic: hold bacteria from growing.

\*\*\* Bactericidal: kill bacteria.

Drugs	Clarithromycin	Azithromycin
<b>Antibacterial spectrum</b>	<ul style="list-style-type: none"> <li>● More effective on <b>G+ve</b> bacteria</li> </ul>	<ul style="list-style-type: none"> <li>● More effective on <b>G-ve</b> bacteria</li> </ul>
<b>Pharmacokinetics</b>	<ul style="list-style-type: none"> <li>● Stable at gastric acidity</li> <li>● Inhibits cytochrome P450 system</li> <li>● Metabolized in liver to active metabolite</li> <li>● Biliary route is the major route of elimination</li> <li>● Only 10-15% excreted unchanged in the urine</li> </ul>	<ul style="list-style-type: none"> <li>● Stable at gastric acidity</li> <li>● No effect on cytochrome P-450.</li> <li>● Undergo some hepatic metabolism (inactive metabolite)</li> <li>● Biliary route is the major route of elimination</li> <li>● Only 10-15% excreted unchanged in the urine</li> </ul>
<b>Half-life</b>	<ul style="list-style-type: none"> <li>● Half-life 6-8 hours</li> </ul>	<ul style="list-style-type: none"> <li>● Half-life (3 days)</li> </ul>
<b>Dose</b>	-	<ul style="list-style-type: none"> <li>● Once daily dosing</li> </ul>
<b>Clinical Uses</b>	<ol style="list-style-type: none"> <li>1. Chlamydial pneumonia</li> <li>2. Legionella pneumonia</li> </ol>	
<b>Adverse effects</b>	<ul style="list-style-type: none"> <li>● GI Disturbances</li> <li>● Hypersensitivity Reactions</li> </ul> <p>*Dr. Aliah's notes: Anorexia, nausea, vomiting, &amp; diarrhea are common. GI intolerance, which is due to a direct stimulation of gut motility, is the most common reason for discontinuing erythromycin &amp; substituting another antibiotic.</p>	

### Dr. Aliah's notes:

- Erythromycin base is destroyed by stomach acid and must be administered with enteric coating. Clarithromycin is derived from erythromycin by addition of a methyl group and has improved acid stability and oral absorption compared with erythromycin.
- Erythromycin & clarithromycin inhibit CytP 3A4
- Erythromycin is active against susceptible strains of gram-positive organisms, especially pneumococci, streptococci, staphylococci, & corynebacteria.
- Mycoplasma pneumoniae, L pneumophila, Chlamydia trachomatis, Chlamydia psittaci, Chlamydia pneumoniae, H pylori, Listeria monocytogenes, & certain mycobacteria (Mycobacterium kansasii, Mycobacterium scrofulaceum) are also susceptible.
- Clarithromycin & erythromycin are similar with respect to antibacterial activity except that clarithromycin is > active against Mycobacterium avium complex. The advantages of clarithromycin compared with erythromycin are lower incidence of GI intolerance & less frequent dosing.

# Fluoroquinolones

Drugs	Ciprofloxacin	Moxifloxacin	Gatifloxacin
Antibacterial spectrum	G- <b>ve</b> bacteria highly active against Pseudomonas species	G -ve & G+ve highly active against Pseudomonas species	
Pharmacokinetics	<ul style="list-style-type: none"> <li>Given po or parenterally</li> <li>Concentrates in many tissues (kidney, prostate, lung &amp; bones/ joints) it means it can treat infections in these organs.</li> <li>Excreted mainly through the kidney</li> <li>long Half-life</li> </ul>		
Dose	twice-daily	once daily	
Mechanism of action	Block bacterial DNA synthesis by inhibiting <b>DNA Gyrase enzyme</b> (an enzyme involved in DNA supercoiling).		
Clinical Uses	<ol style="list-style-type: none"> <li>Acute exacerbation of chronic obstructive pulmonary disease.</li> <li>Community acquired pneumonia.</li> <li>Legionella pneumonia.</li> </ol>		
Adverse effects	<ul style="list-style-type: none"> <li>❖ Nausea, vomiting and diarrhea</li> <li>❖ CNS effects (confusion, insomnia, headache and anxiety)</li> <li>❖ Damage of growing cartilage (<b>arthropathy</b>)</li> <li>❖ Phototoxicity (avoid excessive sunlight) cause skin irritation</li> </ul>		
Contraindications	<ul style="list-style-type: none"> <li>Not recommended for patients younger than 18 years</li> <li>Pregnancy</li> <li>Breastfeeding women</li> </ul>		

# Remember

- Penicillin, Moxifloxacin and Gatifloxacin are Effective against **gram-ve** and **gram+ve**.
- Cephalexin, Clarithromycin effective against **gram+ve** only.
- Cefuroxime, Cefaclor, Ceftriaxone, Cefotaxime, Cefixime, Azithromycin and Ciprofloxacin Effective against **gram-ve** only.
- Penicillin and Cephalosporins are Inhibit bacterial **cell wall** synthesis ( Bactericidal).
- Macrolides (Azithromycin, Clarithromycin) :Inhibit **protein** synthesis by binding to 50S subunit of the bacterial ribosomes (Bacteriostatic) and At high doses: Bactericidal.
- Fluoroquinolones (Ciprofloxacin, Moxifloxacin ,Gatifloxacin): inhibits **DNA** gyrase enzyme, which is an enzyme involved in DNA supercoiling.

## MCQs

1-Which of the following cephalosporins is used against gram positive bacteria ?

- A. Cephalexin
- B. Clarithromycin.
- C. Penicillin.
- D. Moxifloxacin.

2-Penicillins are used to treat

- A. URTIs
- B. LRTIs
- C. Both a and c
- D. None of above

3-Legionella pneumonia can be treated with

- A. Clarithromycin.
- B. Ciprofloxacin
- C. Moxifloxacin
- D. All of above

4-which antibiotic is contraindicated for pregnant women?

- A. Gatifloxacin
- B. Ampicillin
- C. Cefaclor
- D. Amoxicillin

5-which of these is a side effect of Fluoroquinolones?

- A. CNS effects (confusion, insomnia, headache & anxiety)
- B. Arthropathy
- C. Phototoxicity
- D. All of above

6-which of these antibiotics is safely used in renal failure?

- A. Gatifloxacin
- B. Ampicillin
- C. Azithromycin
- D. Amoxicillin

## SAQs

- What is the drug is used in both LRTIs and URTIs ?
- What are 3 adverse effect that is expected to see in this patient after giving him the drug ?

Answers:  
1. A  
2. C  
3. D  
4. A  
5. D  
6. C

Answers:  
1. Penicillin.  
2. Hypersensitivity reactions, diarrhea and superinfections.

# Good Luck & Thank you !
