PRACTICAL

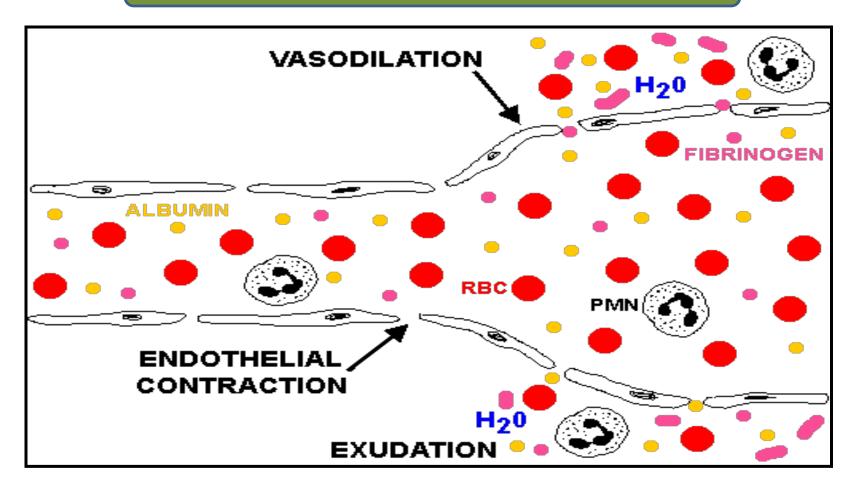

I - Acute Inflammation

2018

Pathology Dept, KSU

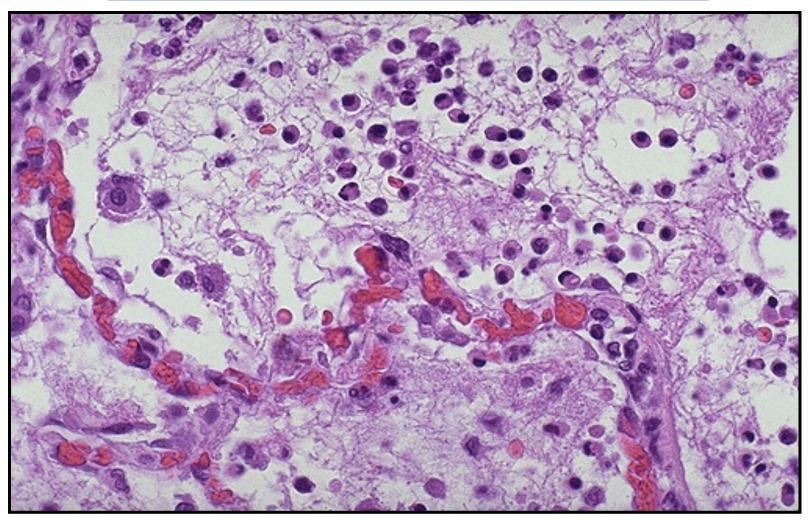

Pathogenesis of Exudation

The process of exudation, aided by endothelial cell contraction and vasodilation, which typically is most pronounced in venules. Collection of fluid in a space is a transudate. If this fluid is protein-rich and has many cells then it becomes an exudate.

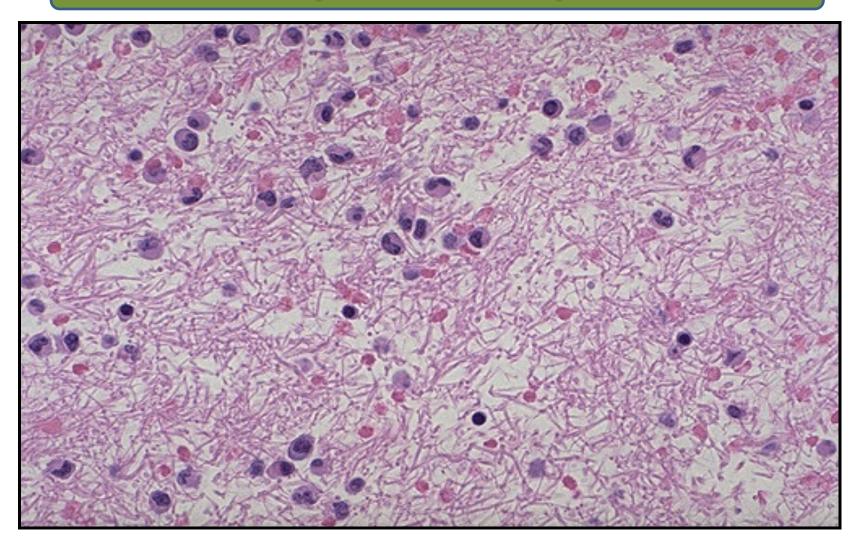

Pathology Dept, KSU

Exudation in the Alveolar Space

Here is vasodilation with exudation that has led to an outpouring of fluid with fibrin into the alveolar spaces along with PMN's indicative of an acute bronchopneumonia of the lung,

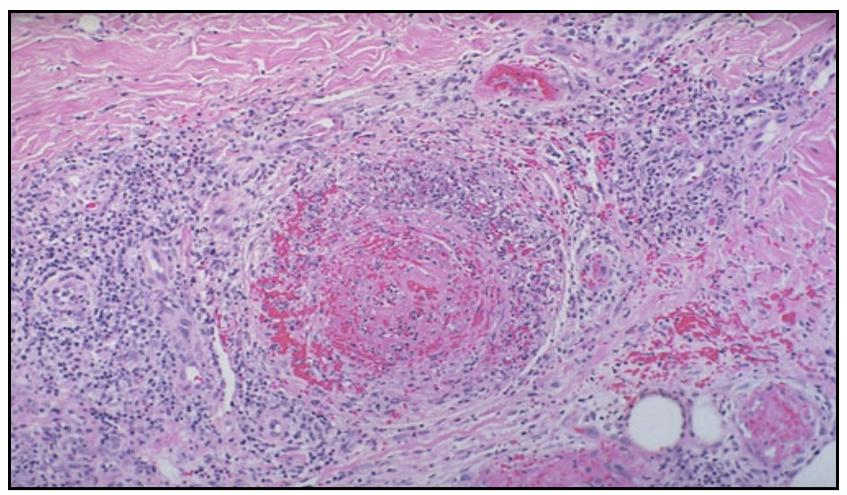

Exudation of Fibrin in Acute Inflammation

Here is an example of the fibrin mesh in fluid with PMN's that has formed in the area of acute inflammation. It is this fluid collection that produces the "tumor" or swelling aspect of acute inflammation.

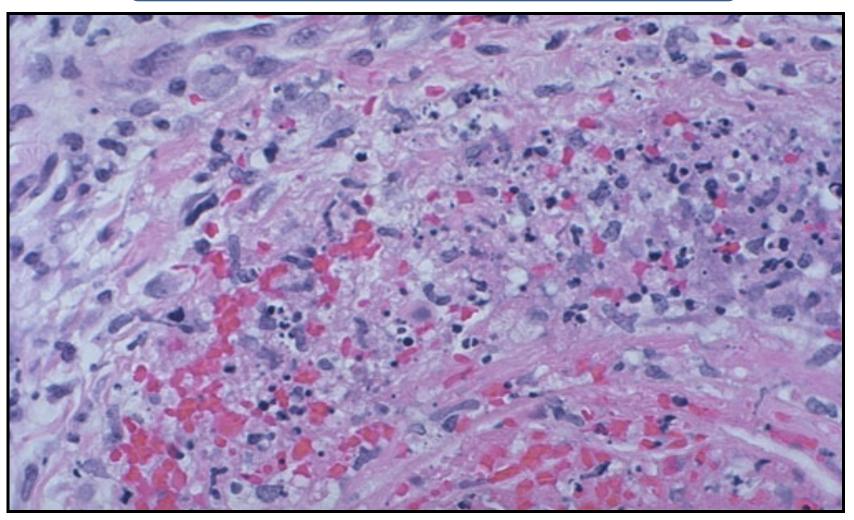

Pathology Dept, KSU

Inflammation with Necrosis - LPF

The vasculitis shown here demonstrates the destruction that can accompany the acute inflammatory process and the interplay with the coagulation mechanism. The arterial wall is undergoing necrosis, and there is thrombus formation in the lumen.

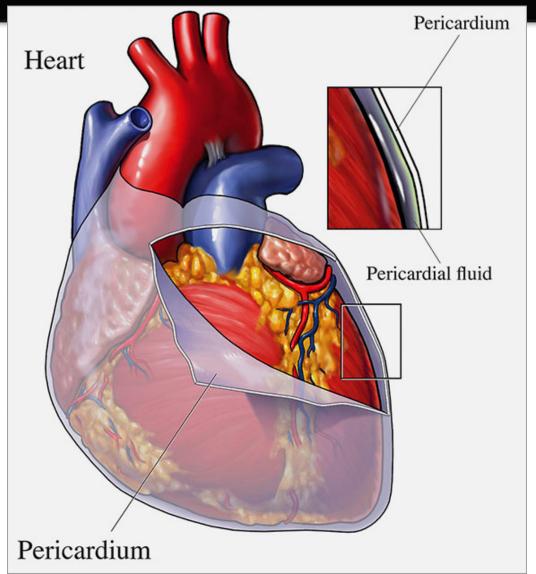

Inflammation with Necrosis - HPF

At higher magnification, vasculitis with arterial wall necrosis is seen. Note the fragmented remains of neutrophilic nuclei (karyorrhexis). Acute inflammation is a non-selective process that can lead to tissue destruction

Pathology Dept, KSU

1- Fibrinous Pericarditis

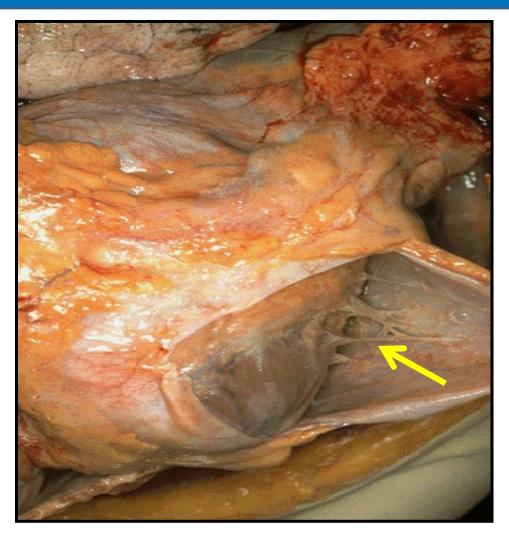

Pathology Dept, KSU

Normal pericardium

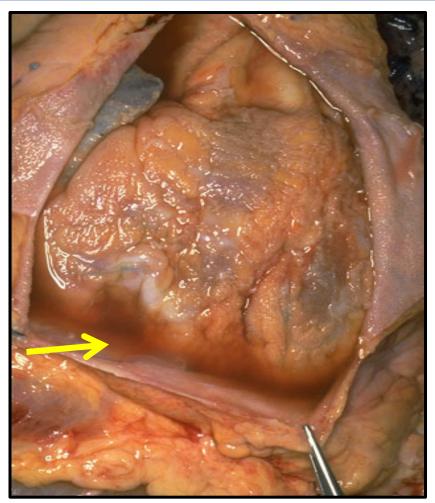

Acute Fibrinous Pericarditis - Gross

Here, the pericardial cavity has been opened to reveal a fibrinous pericarditis with strands of stringy pale fibrin between visceral and parietal pericardium

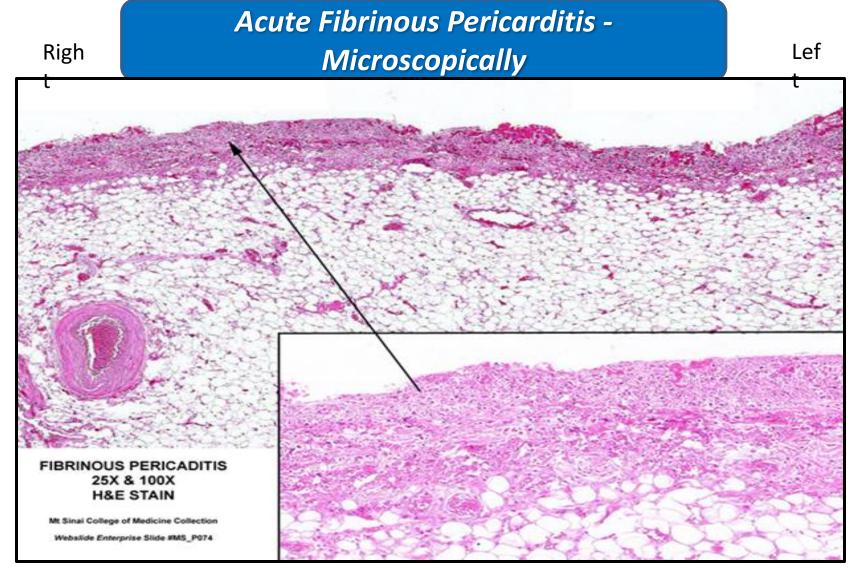

Pathology Dept, KSU

Acute Fibrinous Pericarditis - Gross

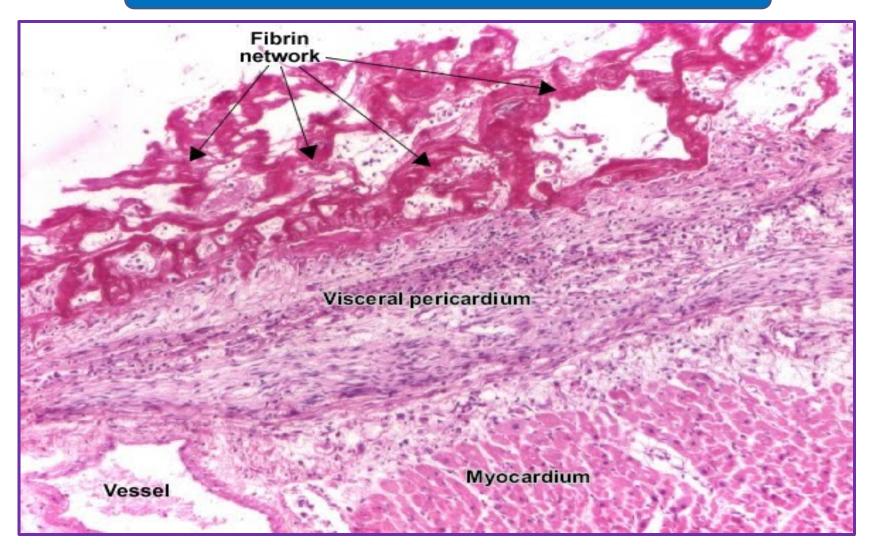

Serous fluid at the bottom of the pericardial cavity (arrow) is visible. The epicardial surface appears roughened, compared to its normal glistening appearance; due to the strands of pink-tan fibrin that have formed

Pathology Dept, KSU

The fibrinous exudate is seen to consist of pink strands of fibrin gutting from the pericardial surface at the upper right .The exudate on the surface is shown enlarged in the inset. Note a considerable number of erythrocytes trapped in the mesh of fibrin threads.

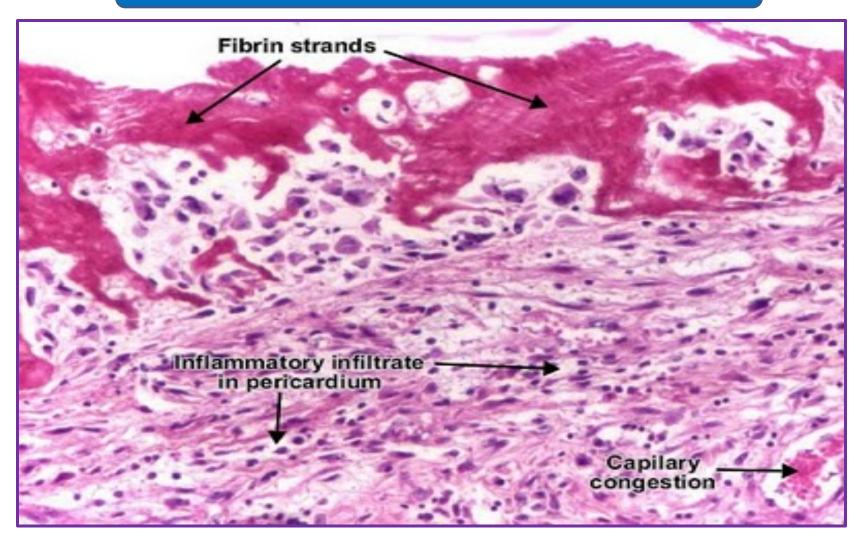

Acute Fibrinous Pericarditis - LPF

The pericardium is distorted by thick irregular layer of pinkish fibrinous exudate with some red cells and inflammatory cells

Pathology Dept, KSU

Acute Fibrinous Pericarditis - HPF

The subpericardial layer is thickened by edema and shows dilated blood vessels, chronic inflammatory cells and areas of calcification.

Pathology Dept, KSU

2- Acute Appendicitis

Pathology Dept, KSU

Normal Appendix - Gross

This is the normal appearance of the appendix against the background of the caecum.

Pathology Dept, KSU

Acute Appendicitis - Gross

Seen here is acute appendicitis with yellow to tan exudate and hyperemia, including the periappendiceal fat superiorly, rather than a smooth, glistening pale tan serosal surface

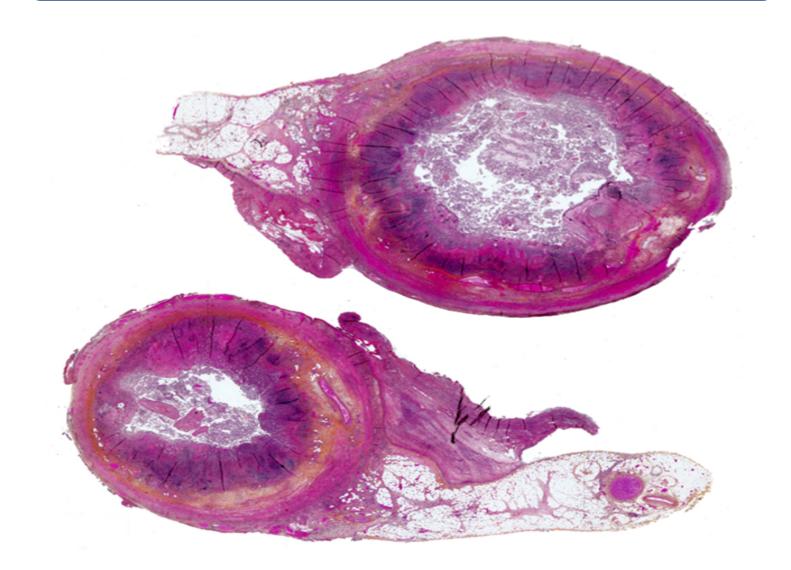

Pathology Dept, KSU

Acute Appendicitis – Longitudinal section

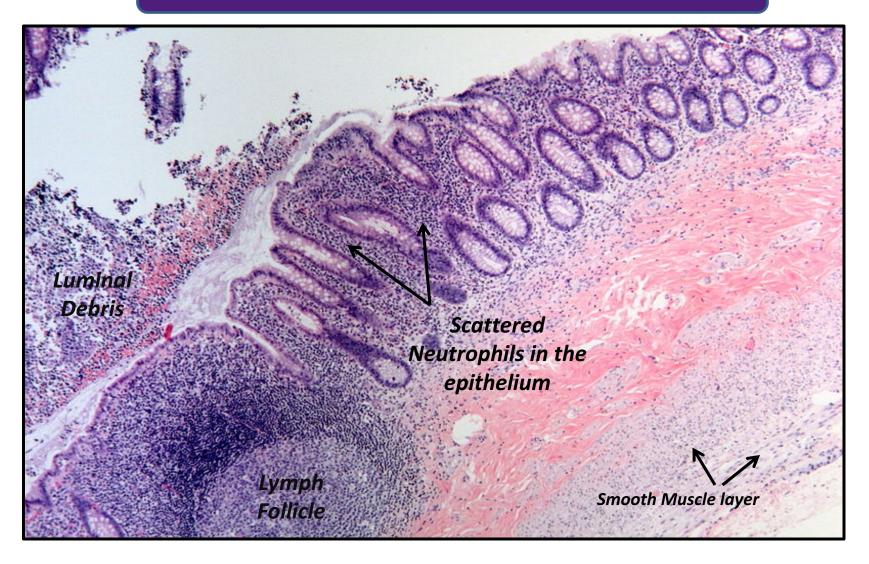

A case of acute appendicitis : The organ is enlarged and sausage-like (botuliform). This longitudinal section shows the angry red inflamed mucosa with its irregular luminal surface. This appendix does not show late complications, like transmural necrosis, perforation, and abscess formation

Acute Appendicitis – LPF of the cut section

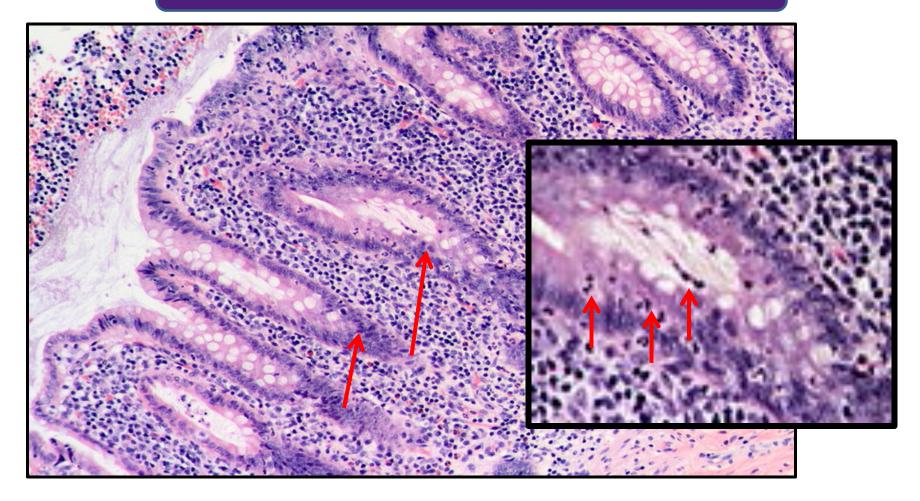

Pathology Dept, KSU

Acute Appendicitis – LPF

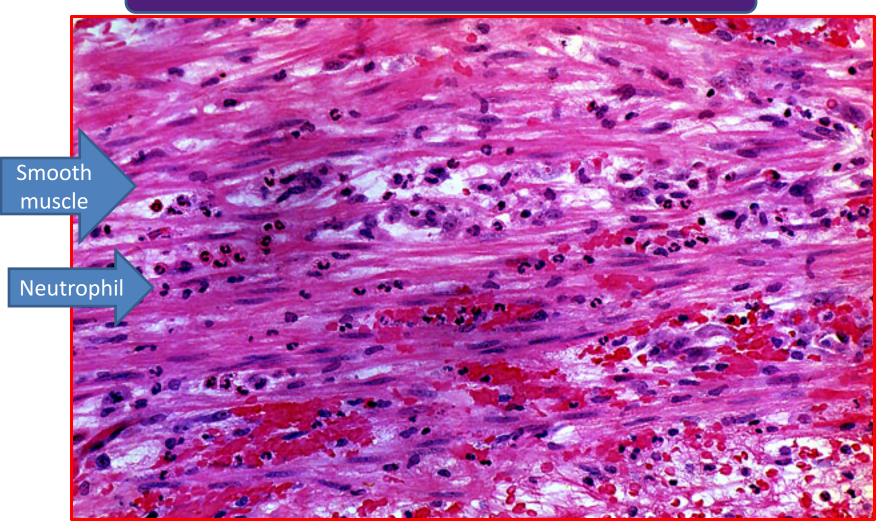

Acute Appendicitis – HPF

Scattered Neutrophils in the crypt epithelium

Pathology Dept, KSU

Acute Appendicitis – Histopathology

This slide shows the muscle layer of the appendix which is permeated with numerous polymorphonuclear leukocytes

Pathology Dept, KSU

3- Acute Cholecystitis

Pathology Dept, KSU

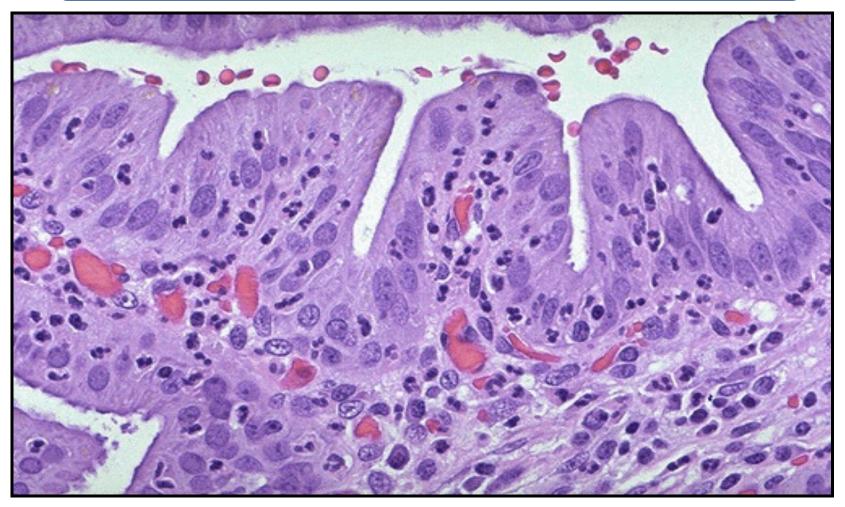

Acute Cholecystitis – Gross

Mucocele, stone obstructed the neck , distended , aspiration done and removed by lap chole

Pathology Dept, KSU

Acute Cholecystitis – Histopathology HPF

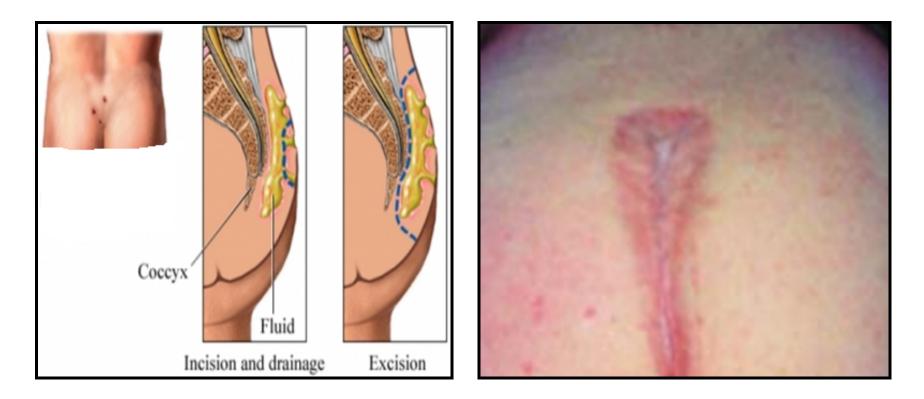

The neutrophils are seen infiltrating the mucosa and submucosa of the gallbladder in this patient with acute cholecystitis and right upper quadrant abdominal pain with tenderness on palpation

Pathology Dept, KSU

4- Skin Pilonidal Sinus

Pathology Dept, KSU

Foreign Body Reaction (Pilonidal Sinus)

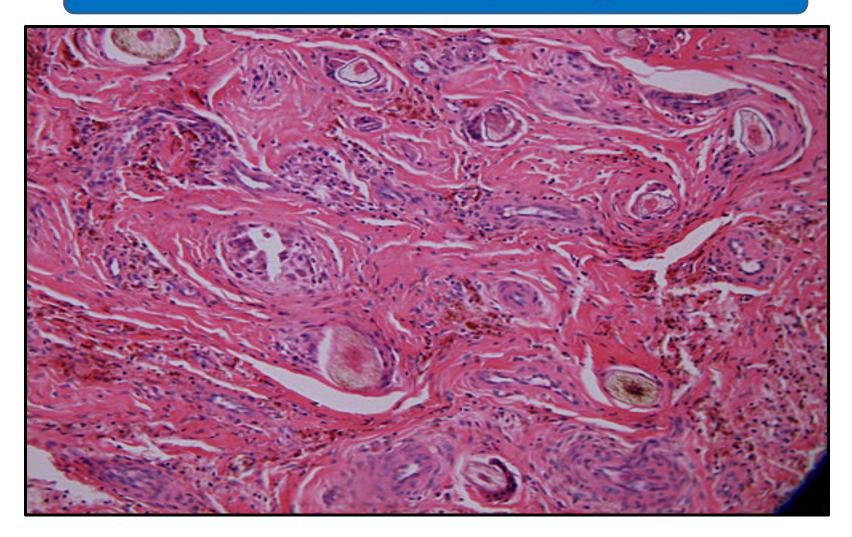

A pilonidal sinus is a sinus tract which commonly contains hairs. It occurs under the skin between the buttocks (the natal cleft) a short distance above the anus. Usually runs vertical between the buttocks and rarely occurring outside the coccygeal region.

Foreign Body Reaction (Pilonidal Sinus)

Surgically excised pilonidal sinus tracts

Pilonidal Sinus – Histopathology LPF

The lumen of the sinus and wall contain large number of hair shafts with foreign body giant cells, lymphocytes, macrophages & neutrophils

II - Chronic Inflammation

Pathology Dept, KSU

1- Chronic cholecystitis with stones

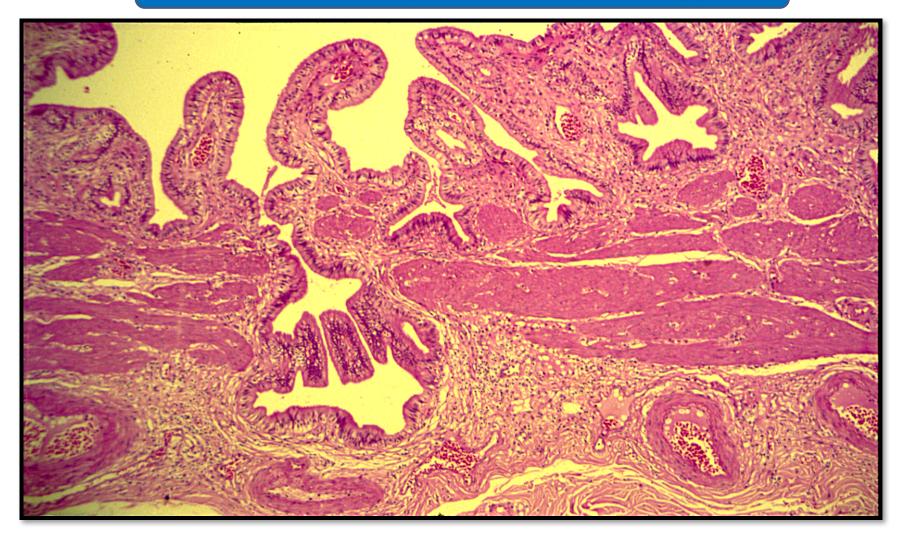

Chronic cholecystitis with Gall Stones

Gross appearance of gallbladder after sectioning longitudinally. Notice thickness of gall bladder wall, abundant polyhedric stones and small papillary tumor in the cystic duct.

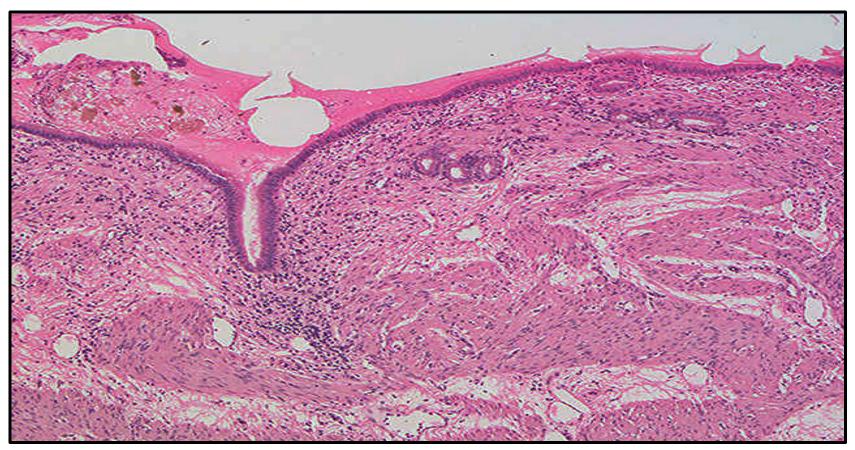

Pathology Dept, KSU

Chronic cholecystitis - Histopathology

Irregular mucosal folds and foci of ulceration in mucosa. Wall is penetrated by mucosal glands which are present in muscle coat (Rokitansky-Aschoff sinuses). All layers show chronic inflammatory cells infiltration and *fibrosis.*

Chronic cholecystitis - Histopathology

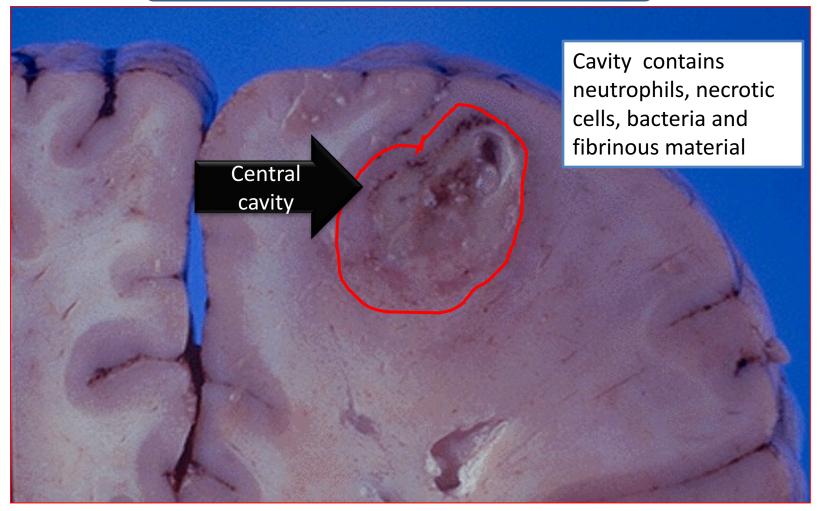

The mucosa is atrophic, with a single layer of flattened epithelium. There is proteinaceous fluid adherent to the mucosal surface, with some bile stained orange-brown crystals toward the upper left in the lumen. The lamina propria shows fibrosis and contains a mononuclear cell infiltrate (small dark blue nuclei).

The muscle is hypertrophied compared to normal gallbladder.

Pathology Dept, KSU

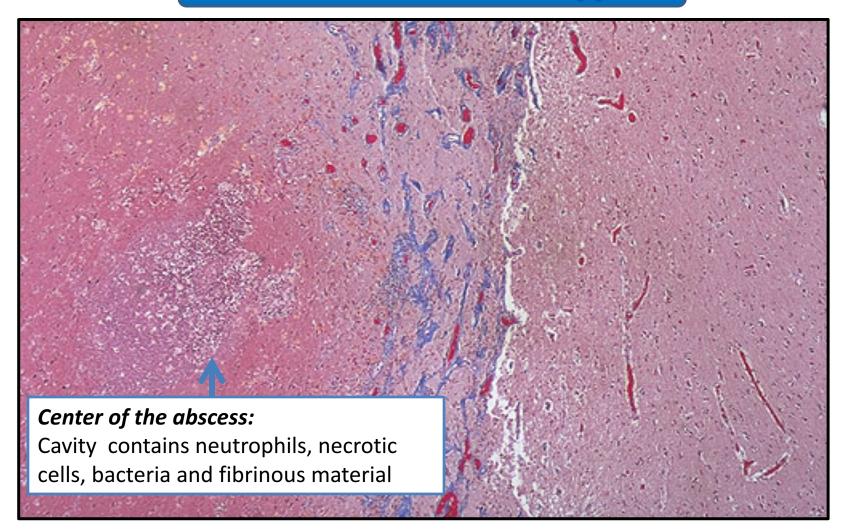

Brain Abscess - gross

CT of a cerebral abscess. There is a liquefactive center with yellow pus surrounded by a thin wall. Abscesses usually result from hematogenous spread of bacterial infection, but may also occur from direct penetrating trauma or extension from adjacent infection in sinuses

Pathology Dept, KSU

Brain Abscess - microscopy

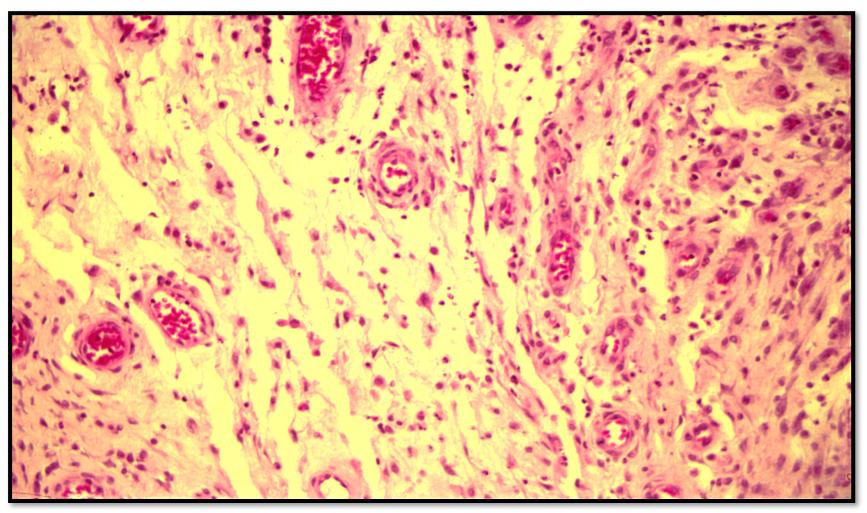

This trichrome stain demonstrates the light blue connective tissue in the wall of an organizing cerebral abscess. Normal brain is at the right and the center of the abscess at the left.

Pathology Dept, KSU

Pathology Dept, KSU

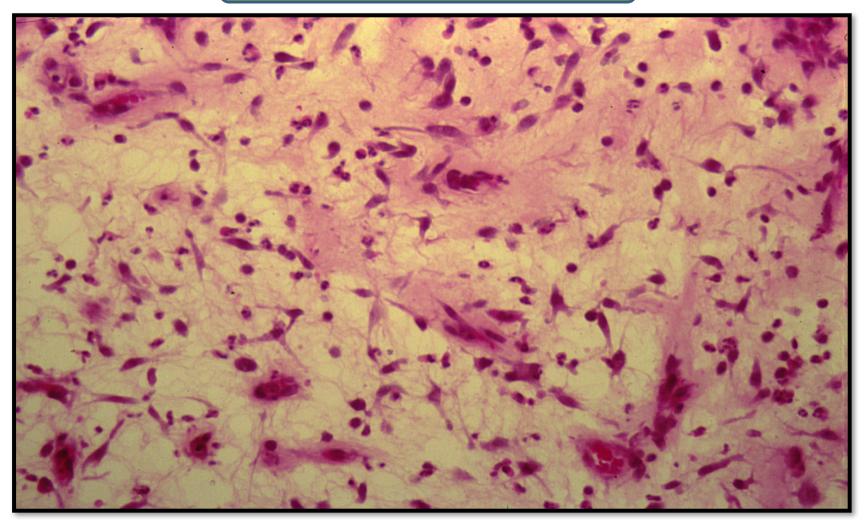

Granulation Tissue - LPF

Section of fragments of edematous, loose connective tissue shows many small newly formed capillaries lined by plump endothelial cells. Proliferation of fibroblasts is seen

Pathology Dept, KSU

Granulation Tissue - HPF

Inflammatory cells including macrophages, lymphocytes, plasma cells and neutrophils in the oedematous stroma. Pink homogenous collagen fibers may be identified.

Pathology Dept, KSU

GOOD LUCK
