Pharmacology of drugs used in bronchial asthma & COPD

By

Prof. Hanan Hagar Pharmacology Unit King Saud University

ILOS: The students should be able to

- 1. Different types of drugs used for treatment of asthma
- 2. Differentiate between treatment and prophylactic therapy for asthma
- 3. Recognize the different types of bronchodilators regarding pharmacokinetics, pharmacodynamics, uses and side effects.
- 4. Identify the different anti-inflammatory drugs for asthma in respect to kinetics, dynamics, uses and side effects.

Bronchial Asthma

Asthma is a chronic inflammatory disorder of bronchial airways that result in airway obstruction in response to external stimuli or triggers

Examples of external stimuli:

Pollen grains, cold air and tobacco smoke, animal fur.

Characters of bronchial airways in asthmatic patients:

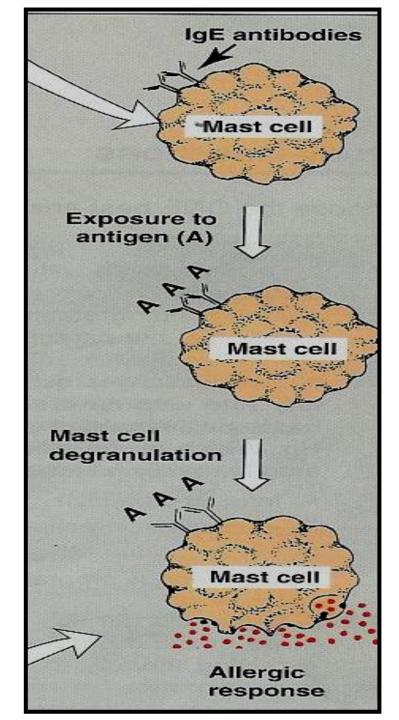

- Airway hyper-reactivity:
- Inflammation
- Bronchospasm

Airway Hyper-reactivity

Is abnormal sensitivity of the airways to any external stimuli.

Hyper-reactivity results into release of endogenous inflammatory mediators.

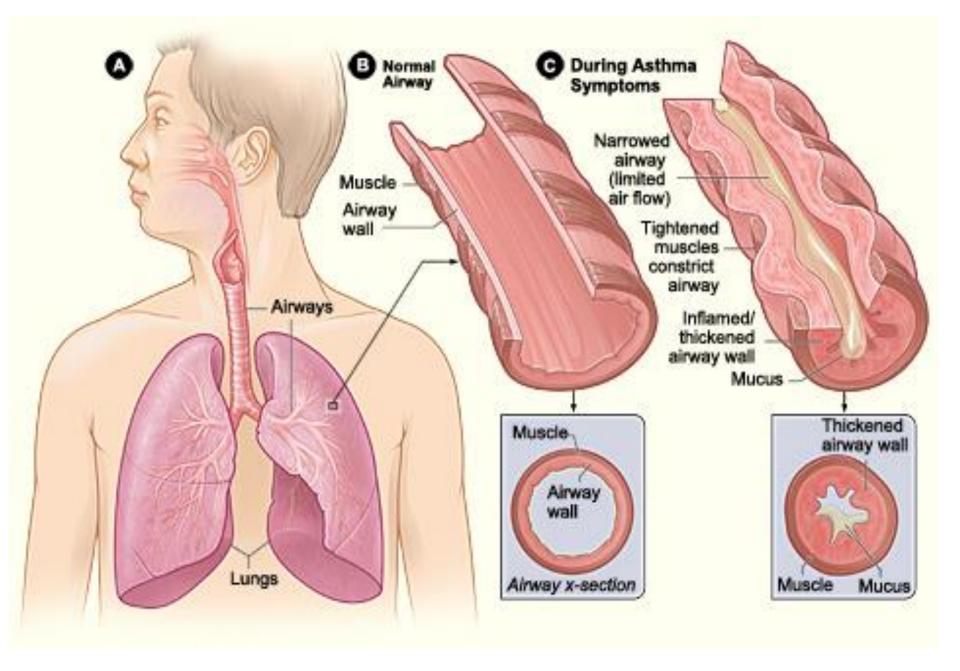

e.g. histamine, leukotrienes

Characters of airways in asthmatic patients:

- Inflammation
 - ↑ edema, swelling
 - **■** ↑ Thick mucus production.

 Bronchospasm (constriction of the bronchial smooth muscles).

Symptoms of asthma

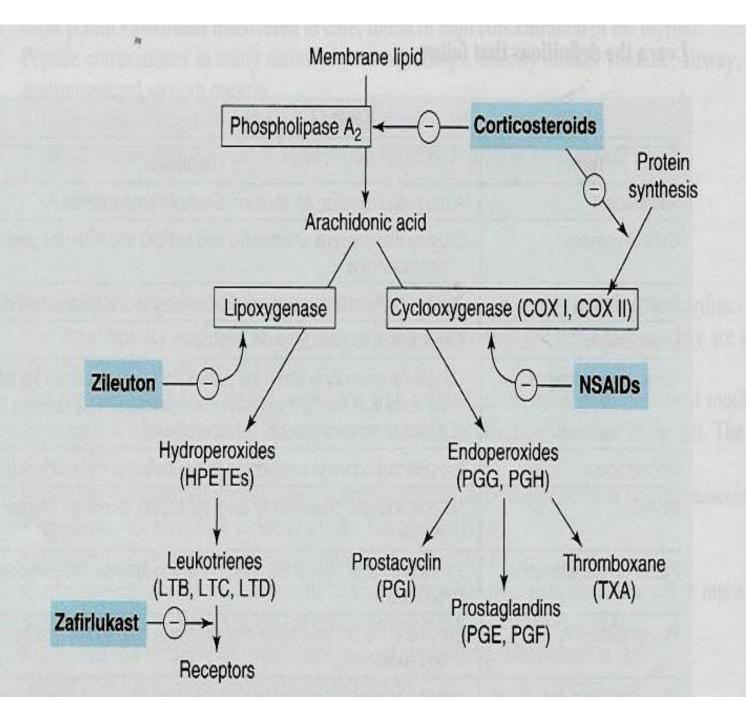

Asthma produces recurrent episodic attack of

- Acute bronchoconstriction
- Shortness of breath
- Chest tightness
- Wheezing
- Rapid respiration
- Cough

Symptoms can happen each time the airways are irritated by inhaled irritants or allergens.

Triggers

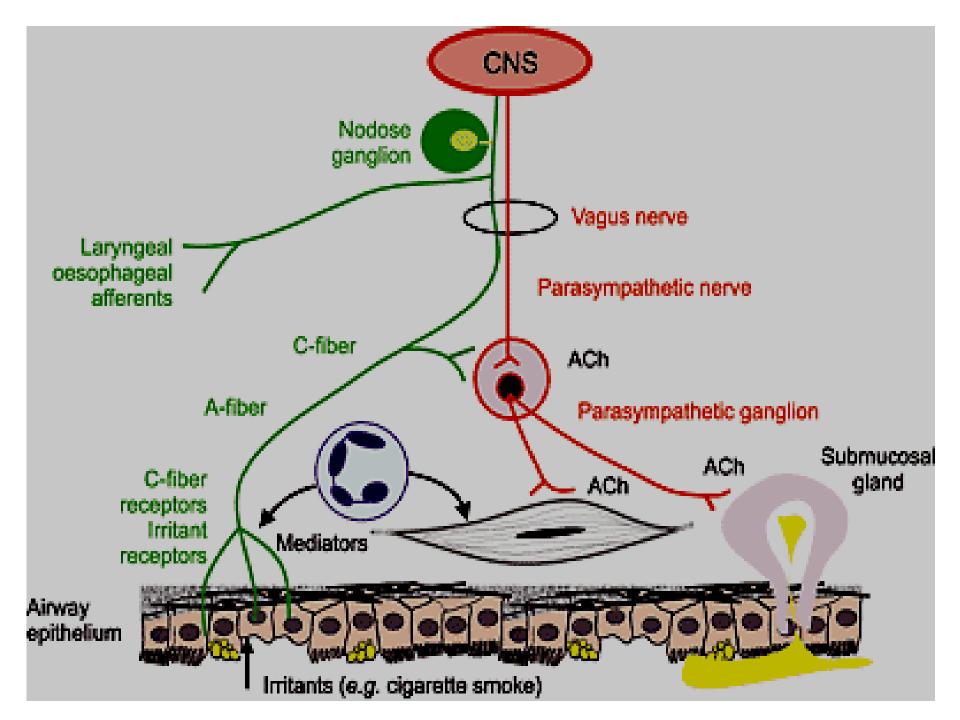

- Exogenous chemicals or irritants
- Chest infections
- Stress
- Exercise (cold air)
- Pets
- Seasonal changes
- Emotional conditions
- Some drugs as aspirin, β-bockers

Innervations of respiratory system

- Parasympathetic supply
 - M3 receptors in smooth muscles and glands.
 - > Bronchoconstriction
 - > Increase mucus secretion

- ➤ No sympathetic supply but B₂ receptors in smooth muscles and glands.
 - > Bronchodilation
 - > Decrease mucus secretion

Anti asthmatic drugs

Treatment
Bronchodilators
(Quick relief medications)

treat acute episodic attack of Asthma

- Short acting β2-agonists
- Antimuscarinics
- Xanthine preparations

Prophylactic therapy Anti-inflammatory Agents

(Control medications)

Reduce the frequency of attacks and nocturnal awakenings

- Corticosteroids
- Mast cell stabilizers
- Leukotrienes antagonists
- Anti-IgE monoclonal antibody
- Long acting \$2-agonists

Bronchodilators

These drugs can produce rapid relief of bronchoconstriction.

Bronchodilators:

- > β2 adrenoreceptor agonists
- Antimuscarinics
- Xanthine preparations

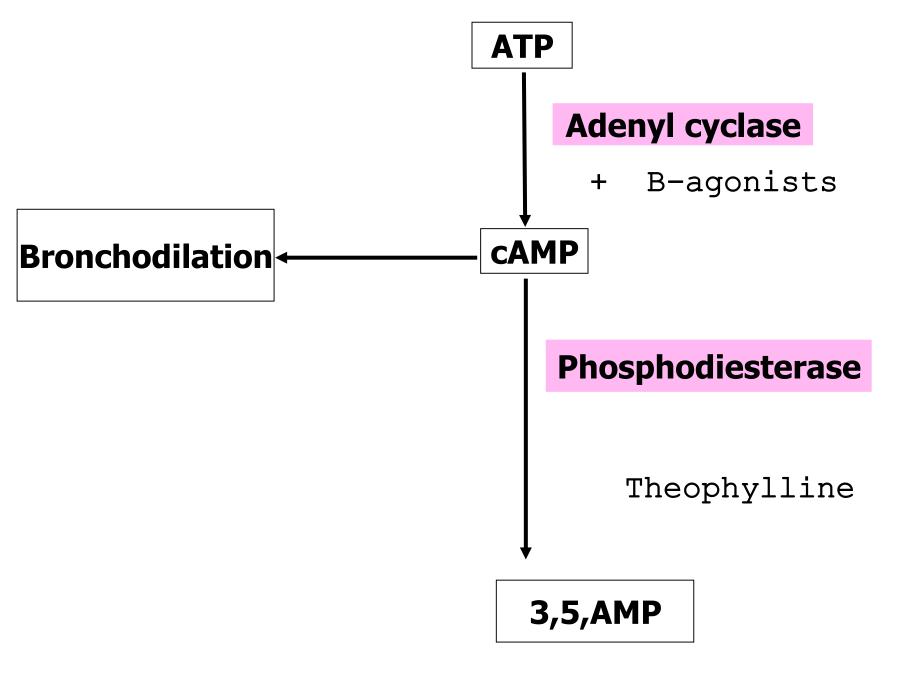

Sympathomimetics β- adrenoceptor agonists

Classification of β agonists

- > Non selective β agonists: epinephrine - isoprenaline
- Selective β2 agonists (Preferable).
 Salbutamol (albuterol)
 Terbutaline
 Salmeterol
 Formeterol

Mechanism of Action

- \triangleright direct β₂ stimulation \longrightarrow stimulate adenyl cyclase \longrightarrow ↑ cAMP \rightarrow bronchodilation.
- ➤ Increase mucus clearance by (increasing ciliary activity).
- > Stabilization of mast cell membrane.

Non selective β -agonists.

Epinephrine

- Non-selective adrenergic agonist $(\alpha_1, \alpha_2, \beta_1, \beta_2)$.
- Potent bronchodilator
- Given subcutaneously, S.C., I.M.
- Rapid onset of action.
- Has short duration of action (60-90 min.)
 - **Drug of choice** for acute anaphylaxis (hypersensitivity reactions).

Disadvantages

- > Not effective orally.
- > Hyperglycemia
- > Skeletal muscle tremor
- > CVS side effects: tachycardia, arrhythmia, hypertension
- > Not suitable for asthmatic patients with hypertension or heart failure.

Contraindications:

CVS patients, diabetic patients

Selective \(\beta 2 \) –agonists

- Are mainly given by inhalation by (metered dose inhaler or nebulizer).
- > Can be given orally, parenterally.
- Short acting ß2 agonists
 e.g. salbutamol, terbutaline
- Long acting ß2 agonistse.g. salmeterol, formoterol

Nebulizer

Inhaler

Short acting B₂ agonists

Salbutamol, inhalation, orally, i.v.

Terbutaline, inhalation, orally, s.c.

- > Have rapid onset of action.
- > short duration of action (4-6 hr)
- > are drugs of choice for acute episodic attack of asthma.

Long acting selective B2 agonists

Salmeterol & formoterol

- > are given by inhalation
- ➤ Long acting bronchodilators (12 hours) due to high lipid solubility (creates depot effect).
- > are not used to relieve acute episodes of asthma
- > used for nocturnal asthma.
- > combined with inhaled corticosteroids to control asthma (decreases the number and severity of asthma attacks).

Advantages of B₂ agonists

- > Minimal CVS side effects
- > suitable for asthmatic patients with
- CV disorders as hypertension or heart failure.

Disadvantages of B₂ agonists

- > Skeletal muscle tremors.
- > Nervousness
- \triangleright Tolerance (β -receptors down regulation).
- > Overdose may produce tachycardia due to β_1 stimulation.

Muscarinic antagonists

Ipratropium – Tiotropium

- > Act by blocking muscarinic receptors (non selective).
- > given by aerosol inhalation
- > Have delayed onset of action.
- > Quaternary derivatives of atropine (polar).
- > Does not diffuse into the blood
- > Does not enter CNS.
- > Have minimal systemic side effects
- > Ipratropium has short duration of action 3-5 hr
- > Tiotropium has longer duration of action (24 h).

Pharmacodynamics

- > Inhibit bronchoconstriction and mucus secretion
- \triangleright Less effective than β_2 -agonists.

Uses

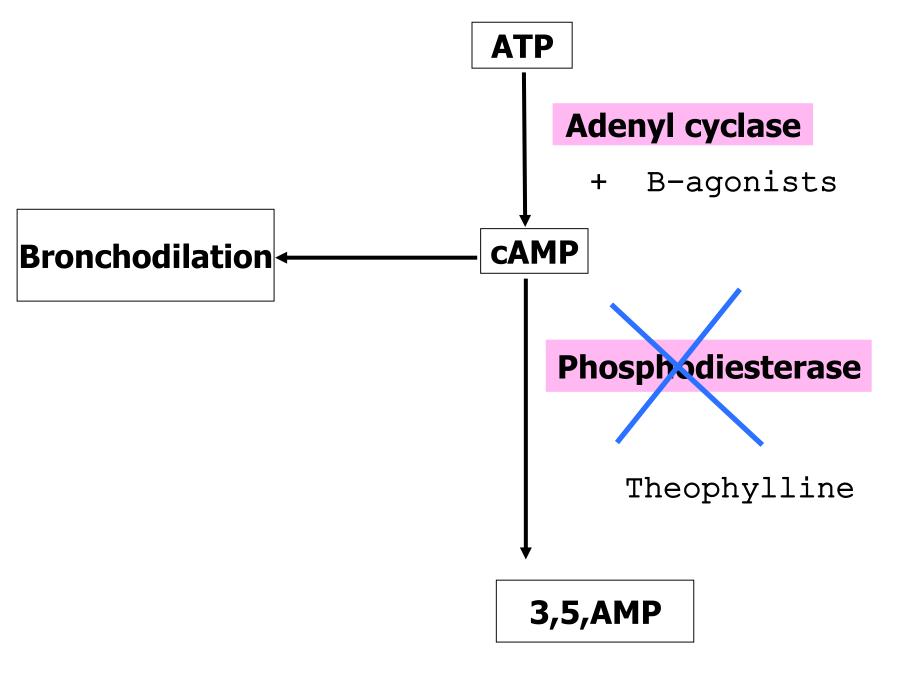

- ➤ Main choice in chronic obstructive pulmonary diseases (COPD).
- > In asthma combined with β_2 agonists & corticosteroids.
- > Never use as a rescue medication.

Methylxanthines

> Theophylline - aminophylline

Mechanism of Action

- > are phosphodiestrase inhibitors
- \rightarrow ↑ cAMP \rightarrow bronchodilation
- > Adenosine receptors antagonists (A1)
- > Increase diaphragmatic contraction
- > Stabilization of mast cell membrane

Pharmacological effects:

- >Bronchial muscle relaxation
- >↑contraction of diaphragm→ improve ventilation
- CVS: ↑ heart rate, ↑ force of contraction
- GIT: ↑ gastric acid secretions
- Kidney: \renal blood flow, weak diuretic action

CNS stimulation

- * stimulant effect on respiratory center.
- * decrease fatigue & elevate mood.
- * Overdose:

(tremors, nervousness, insomnia, convulsion)

Pharmacokinetics

- >Theophylline is given orally
- >Aminophylline, is given as slow infusion
- > metabolized by Cyt P450 enzymes in liver
- $T^{1/2}=8$ hours
- >has many drug interactions
 - > Enzyme inducers:
 - > as phenobarbitone & rifampicin
 - \rightarrow ↑ metabolism of theophylline \rightarrow ↓ T ½.
 - > Enzyme inhibitors:
 - > as erythromycin
 - \downarrow metabolism of the ophylline $\rightarrow \uparrow T \frac{1}{2}$.

Uses

- Second line drug in asthma (theophylline).
- For status asthmatics (aminophylline, is given as slow infusion).

Side Effects

- Low therapeutic index (narrow safety margin) monitoring of theophylline blood level is necessary.
- > GIT effects: nausea & vomiting
- > CVS effects: hypotension, arrhythmia.
- CNS side effects: tremors, nervousness, insomnia, convulsion

Prophylactic therapy Control Medication

Anti - inflammatory drugs include:

- > Glucocorticoids
- > Leukotrienes antagonists
- > Mast cell stabilizers
- > Anti-IgE monoclonal antibody
 - e.g. omalizumab

Anti - inflammatory drugs: (control medications / prophylactic therapy)

- ↓ bronchial hyper-reactivity.
- ↓ reduce inflammation of airways
- ↓ reduce the spasm of airways

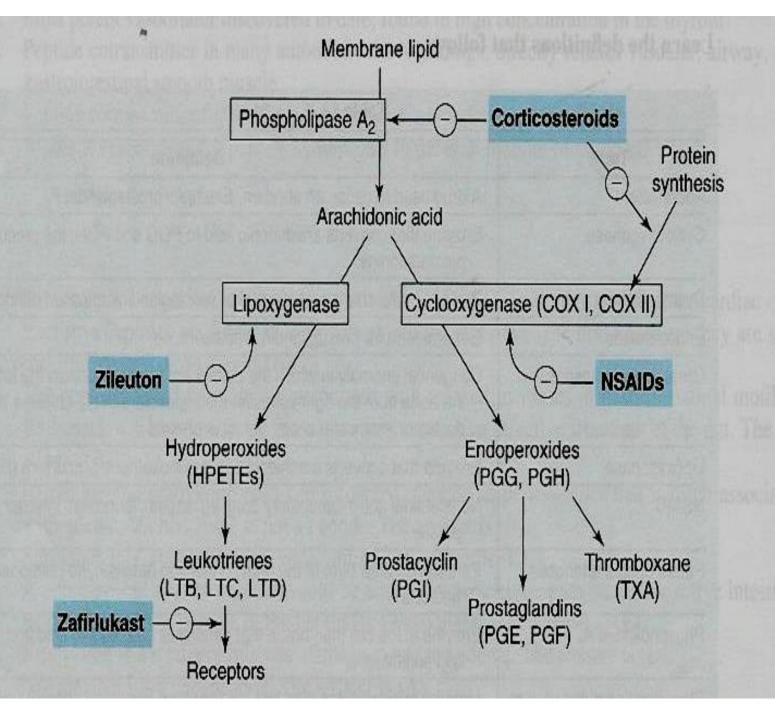

Glucocorticoids

Mechanism of action

- > Anti-inflammatory action due to:
 - Inhibition of phospholipase A2

 - Number of inflammatory cells in airways.
 - \triangleright Mast cell stabilization $\rightarrow \downarrow$ histamine release.

 - > Inhibition of antigen-antibody reaction.
- ightharpoonup Upregulate β₂ receptors (have additive effect to B₂ agonists).

Pharmacological actions of glucocorticoids

- Anti-inflammatory actions
- Immunosuppressant effects
- > Metabolic effects
 - Hyperglycemia
 - — ↑ protein catabolism, ↓ protein anabolism
 - Stimulation of lipolysis fat redistribution
- > Mineralocorticoid effects:
 - sodium/fluid retention
 - -Increase potassium excretion (hypokalemia).
 - -Increase blood volume (hypertension).

- > Behavioral changes: depression
- > Bone loss (osteoporosis) due to
 - Inhibit bone formation
 - — ↓ calcium absorption from GIT.

Routes of administration

- Inhalation:
 - Given by inhalation (metered-dose inhaler).
 - Have first pass metabolism
 - Best choice in asthma, less side effects
 - e.g. Budesonide & Fluticasone, beclometasone
- > **Orally:** Prednisone, methyl prednisolone
- > **Injection:** Hydrocortisone, dexamethasone

Glucocorticoids in asthma

- Are <u>not</u> bronchodilators
- Reduce bronchial inflammation
- Reduce bronchial hyper-reactivity to stimuli
- Have delayed onset of action (effect usually attained after 2-4 weeks).
- Maximum action at 9-12 months.
- Given as prophylactic medications, used alone or combined with β_2 agonists.
- Effective in allergic, exercise, antigen and irritant-induced asthma,

Systemic corticosteroids are reserved for:

- Status asthmaticus (i.v.).

Inhaled steroids should be considered for adults, children with any of the following features

- using inhaled β_2 agonists three times/week
- symptomatic three times/ week or more;
- or waking **one night**/week.

Clinical Uses of glucocorticoids

- Treatment of inflammatory disorders (asthma, rheumatoid arthritis).
- 2. Treatment of **autoimmune disorders** (ulcerative colitis, psoriasis) and after organ or bone marrow transplantation as immunosuppressants.
- 3. Antiemetics in cancer chemotherapy.

Side effects due to systemic corticosteroids

- Adrenal suppression
- Growth retardation in children
- Susceptibility to infections
- Osteoporosis
- Fluid retention, weight gain, hypertension
- Hyperglycemia
- Fat distribution
- Cataract
- Psychosis

Inhalation has very less side effects:

- Oropharyngeal candidiasis (thrush).
- Dysphonia (voice hoarseness).

Withdrawal of systemic corticosteroids

 Abrupt stop of corticosteroids should be avoided and dose should be tapered (adrenal insufficiency syndrome).

Mast cell stabilizers

e.g. Cromoglycate - Nedocromil

Mechanism of action:

- > act by stabilization of mast cell membrane.
- > given by inhalation (aerosol, nebulizer).
- > Have poor oral absorption (10%)

Pharmacodynamics

- are <u>Not</u> bronchodilators
- **Not** effective in acute attack of asthma.
- Prophylactic anti-inflammatory drug
- Reduce bronchial hyper-reactivity.
- Effective in exercise, antigen and irritant-induced asthma.
- Children respond better than adults

Uses

- Prophylactic therapy in asthma especially in children.
- Allergic rhinitis.
- Conjunctivitis.

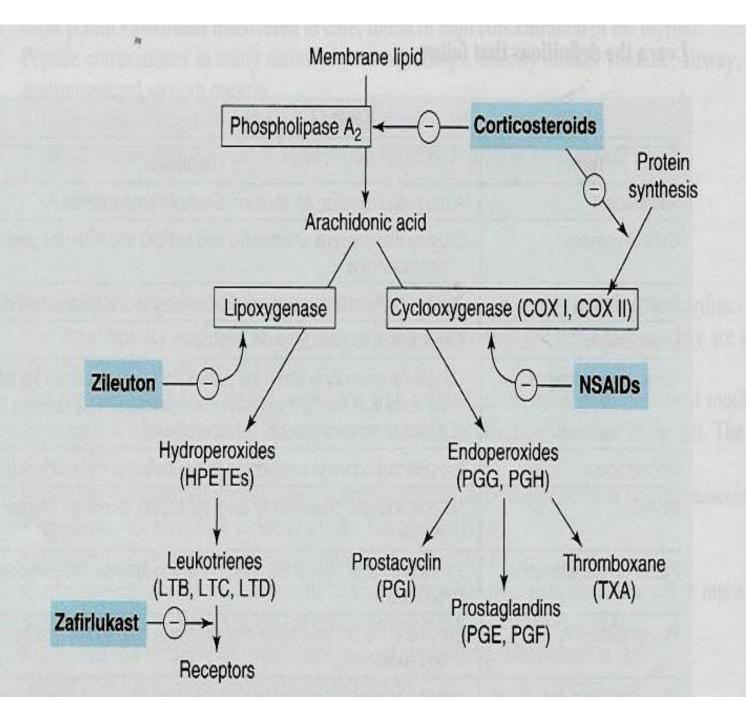

Side effects

- Bitter taste
- minor upper respiratory tract irritation (burning sensation, nasal congestion)

Leukotrienes antagonists

Leukotrienes

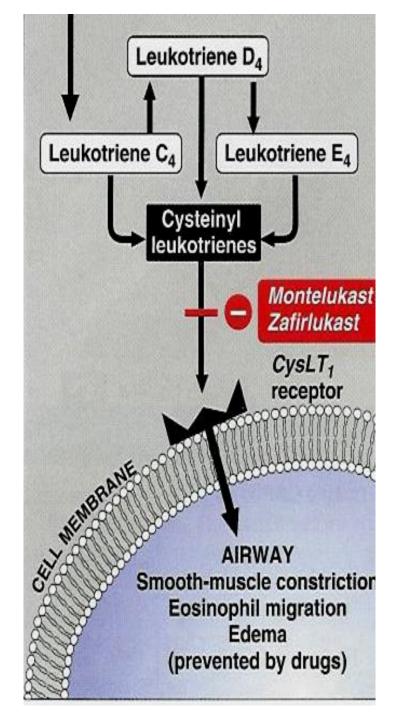

- synthesized by inflammatory cells found in the airways (eosinophils, macrophages, mast cells).
- produced by the action of <u>5-lipoxygenase</u> on arachidonic acid.
- > Leukotriene B4: chemotaxis of neutrophils
- > Cysteinyl leukotrienes C4, D4 & E4:
 - bronchoconstriction
 - increase bronchial hyper-reactivity
 - -↑ mucosal edema, ↑ mucus secretion

Mechanism of action of leukotrienes antagonists

e.g.
Zafirlukast
Montelukast
Pranlukast

are selective, reversible antagonists of cysteinyl leukotriene receptors (CysLT₁receptors).

Leukotriene receptor antagonists

- > Taken orally.
- Are bronchodilators
- > Have anti-inflammatory action
- > Less effective than inhaled corticosteroids.
- > Have glucocorticoids sparing effect.

Uses of leukotriene receptor antagonists

- Not effective in acute attack of asthma.
- Prophylaxis of mild to moderate asthma.
 - e.g. aspirin-induced asthma
 - e.g. antigen and exercise-induced asthma.
- Can be combined with glucocorticoids (additive effects, low dose of glucocorticoids can be used).

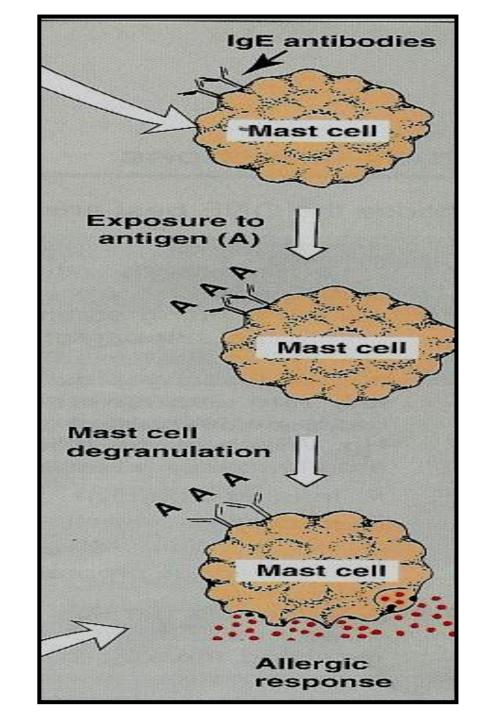

Side effects:

Elevation of liver enzymes, headache, dyspepsia

Anti-IgE monoclonal antibody

e.g. Omalizumab

- is a monoclonal antibody directed against human IgE given by injection (s.c.)
- prevents IgE binding with its receptors on mast cells & basophiles.
- ↓ release of allergic mediators.
- Expensive-not first line therapy.
- used for treatment of moderate to severe allergic asthma which does not respond to high doses of corticosteroids.

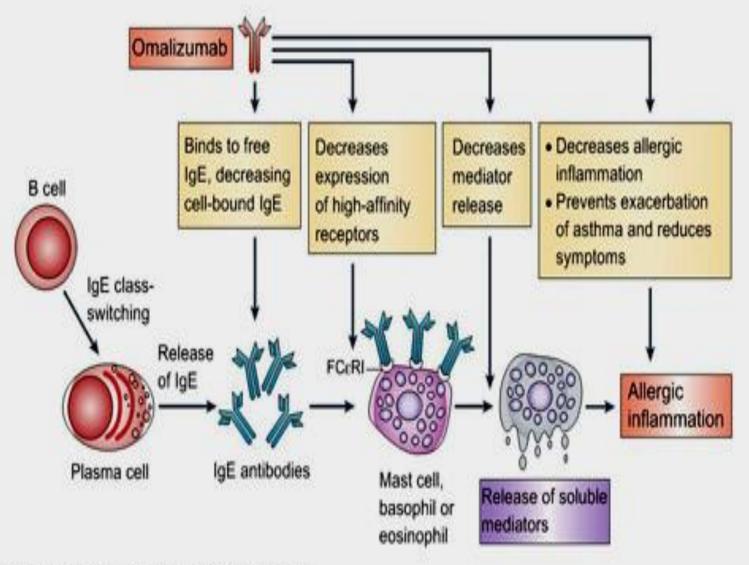

Figure 1. Mechanisms of action of omalizumab in allergic asthma.

Abbreviation: Fc RI, high-affinity IgE receptor.

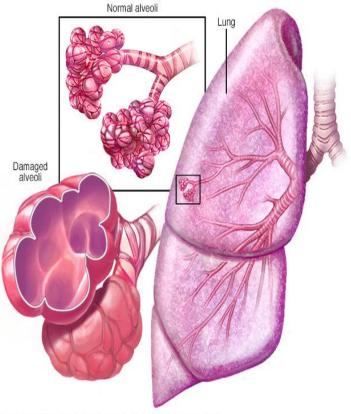

Drugs used in chronic obstructive pulmonary disease (COPD)

- COPD is <u>a chronic irreversible</u> airflow obstruction, lung damage and inflammation of the air sacs (alveoli).
- COPD is characterized by chronic bronchitis and emphysema (destruction of walls of alveoli).

Drugs used in chronic obstructive pulmonary disease (COPD)

• Smoking is a high risk factor but air pollution and genetic factors can contribute.

Treatment:

- Inhaled bronchodilators
- Inhaled glucocorticoids
- Oxygen therapy
- -Antibiotics specifically macrolides such as azithromycin to reduce the number of exacerbations.
- –Lung transplantation

Inhaled bronchodilators in COPD

- > Inhaled antimuscarinics
 - > Ipratropium & tiotropium.
 - \triangleright are superior to β 2 agonists in COPD
- $> \beta_2$ agonists
- > these drugs can be used either alone or combined
 - salbutamol + ipratropium
 - salmeterol + Tiotropium (long acting-less dose frequency).

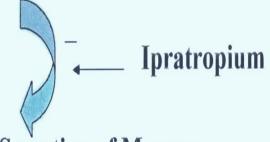

Efferent Vagus Endings

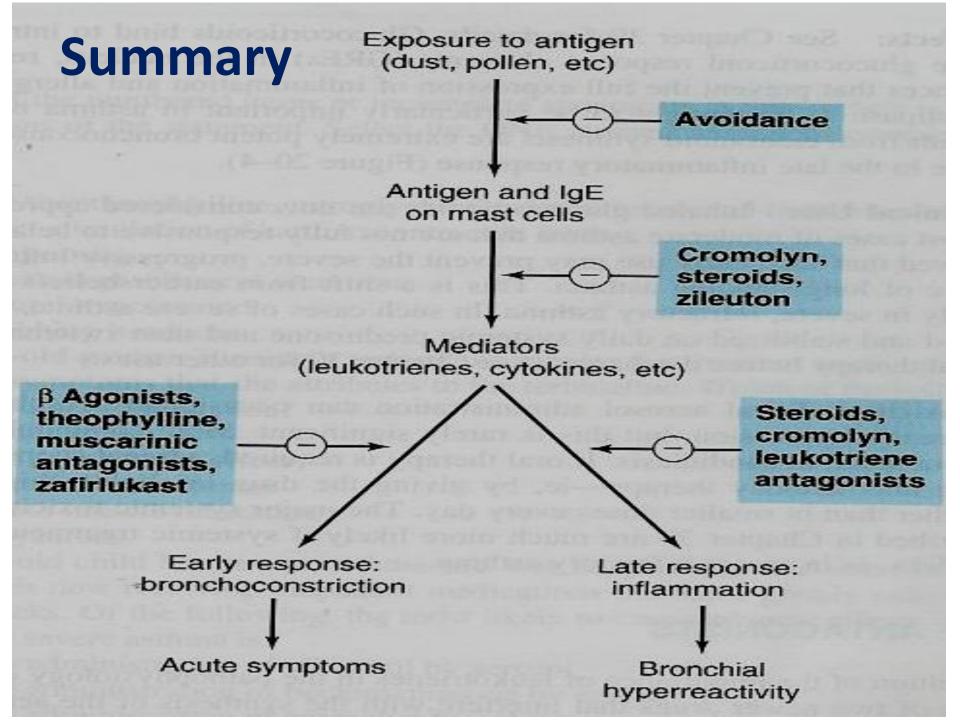

Release of Acetylcholine

Ipratropium____

Contraction of Smooth Muscle

Secretion of Mucous

Bronchodilators (relievers for bronchospasm)

Drugs		
B2 agonists	- Short acting	↑Adenyl
Salbutamol, terbutaline	main choice in acute attack of asthma	cyclase
	Inhalation	↑ cAMP
Salmeterol, formoterol	Long acting, Prophylaxis	CAIVII
	Nocturnal asthma	
Antimuscarinics	Main drugs For COPD	Blocks M
Ipratropium (Short)	Inhalation	recepttors
Tiotropium (long)	Inhalation	
Xanthine derivatives		Inhibits
Theophylline	(orally)	phosphodi
Aminophylline	(parenterally)	esterase ↑ cAMP

Anti-inflammatory drugs (prophylactic)

Corticosteroids (Inhibits phospholipase A2) Dexamethasone, Fluticasone, budesonide	Inhalation
prednisolone	Orally
Hydrocortisone	parenterally
Mast stabilizers Cromoglycate (Cromolyn), Nedocromil	Inhalation, prophylaxis in children
Cysteinyl antagonists (CyLT1 antagoist) Zafirlukast, montelukast	orally
Omalizumab (Anti IgE antibody)	Injection (SC)
