

# DIURETICS

## Part 1

Prof. Hanan Hagar  
Pharmacology Unit

# Diuretics

## Definition

- Are drugs that increase urine volume.
- **Diuresis:** is the process of excretion of water in the urine.
- **Can we use water as a diuretic?**

# Diuretics

- All diuretics have **naturetic** effect.

## **Natriuresis:**

- is the process of **sodium excretion** in the urine

# INDICATIONS of DIURETICS

```
graph TD; A[INDICATIONS of DIURETICS] --> B[Edema of any origin]; A --> C[Congestive heart failure]; A --> D[Hypertension]; A --> E[Elimination of toxins];
```

**Edema of  
any origin**

**Congestive  
heart failure**

**Hypertension**

**Elimination  
of toxins**

# Mechanism of actions of diuretics

- Most diuretics act by interfering with the **normal sodium reabsorption** by the renal tubules resulting into sodium and water excretion.

# Diuretic Sites of Action

# Sites of action for diuretics

## How diuretics produce their effects?

- Target molecules for diuretics are carriers or transporters in luminal membrane of renal tubular cells required for tubular reabsorption of sodium from filtrate back into blood.

# Normal Sodium Re-absorption

| <b>Nephron Segment</b>             | <b>Na<sup>+</sup> Transporter</b>   | <b>Filtered Na<sup>+</sup> re-absorbed</b>            |
|------------------------------------|---|---|
| <b>Proximal convoluted tubules</b> | <b>Na<sup>+</sup>/H<sup>+</sup> transporter<br/>Carbonic anhydrase enzyme</b> | <b>65 %<br/>As NaHCO<sub>3</sub></b>                  |
| <b>Ascending Loop of Henle</b>     | <b>Na<sup>+</sup>/K<sup>+</sup>/2Cl<sup>-</sup> cotransporter</b>             | <b>20-30%<br/>Active reabsorption<br/>Na, K, Cl</b>   |
| <b>Distal convoluted tubules</b>   | <b>Na<sup>+</sup>/Cl<sup>-</sup> transporter</b>                              | <b>5-10%<br/>Active reabsorption<br/>Na, Cl</b>       |
| <b>Cortical Collecting Tubules</b> | <b>Na<sup>+</sup> channel<br/>Aldosterone<br/>Antidiuretic hormone</b>        | <b>5%<br/>Na reabsorption<br/>K &amp; H secretion</b> |

# Site of action of diuretics

| segment                     | Function   | transporter                                 | Diuretics                     |
|-----------------------------|--|---|-------------------------------|
| Proximal convoluted tubules | Re-absorption of 66% Na, K, Ca, Mg, 100% glucose and amino acids; 65% NaHCO <sub>3</sub> | Na/H transporter, Carbonic anhydrase enzyme | Carbonic anhydrase inhibitors |
| Proximal Straight Tubules   | Secretion and re-absorption of organic acids and bases                                   | Acid & base transporter                     | None                          |
| Thick ascending loop        | Active reabsorption 25% Na, K, Cl<br>Secondary Ca, Mg reabsorption                       | Na/K/2Cl transporter                        | Loop diuretics                |
| Distal convoluted tubules   | Active tubular reabsorption of 5%Na, Cl, Ca  | Na and Cl cotransporter                     | Thiazide diuretics            |
| Collecting tubules          | Na reabsorption<br>K & H secretion   | Na channels<br>K & H transporter            | K-sparing diuretics           |

# Types of diuretics

| <b>Nephron Segment</b>             | <b>Na<sup>+</sup> Transporter</b>  | <b>Diuretics</b>                     |
|------------------------------------|--|--------------------------------------|
| <b>Proximal convoluted tubules</b> | <b>Na<sup>+</sup>/H<sup>+</sup> transporter</b><br><b><u>Carbonic anhydrase enzyme</u></b> | <b>Carbonic anhydrase inhibitors</b> |
| <b>Ascending Loop of Henle</b>     | <b>Na<sup>+</sup>/K<sup>+</sup>/2Cl<sup>-</sup> cotransporter</b>                          | <b>Loop diuretics</b>                |
| <b>Distal convoluted tubules</b>   | <b>Na<sup>+</sup>/Cl<sup>-</sup> transporter</b>   | <b>Thiazide diuretics</b>            |
| <b>Cortical Collecting Tubules</b> | <b>Na<sup>+</sup> channel</b><br><b>Aldosterone</b>  | <b>K-sparing diuretics</b>           |

# Classification of diuretics

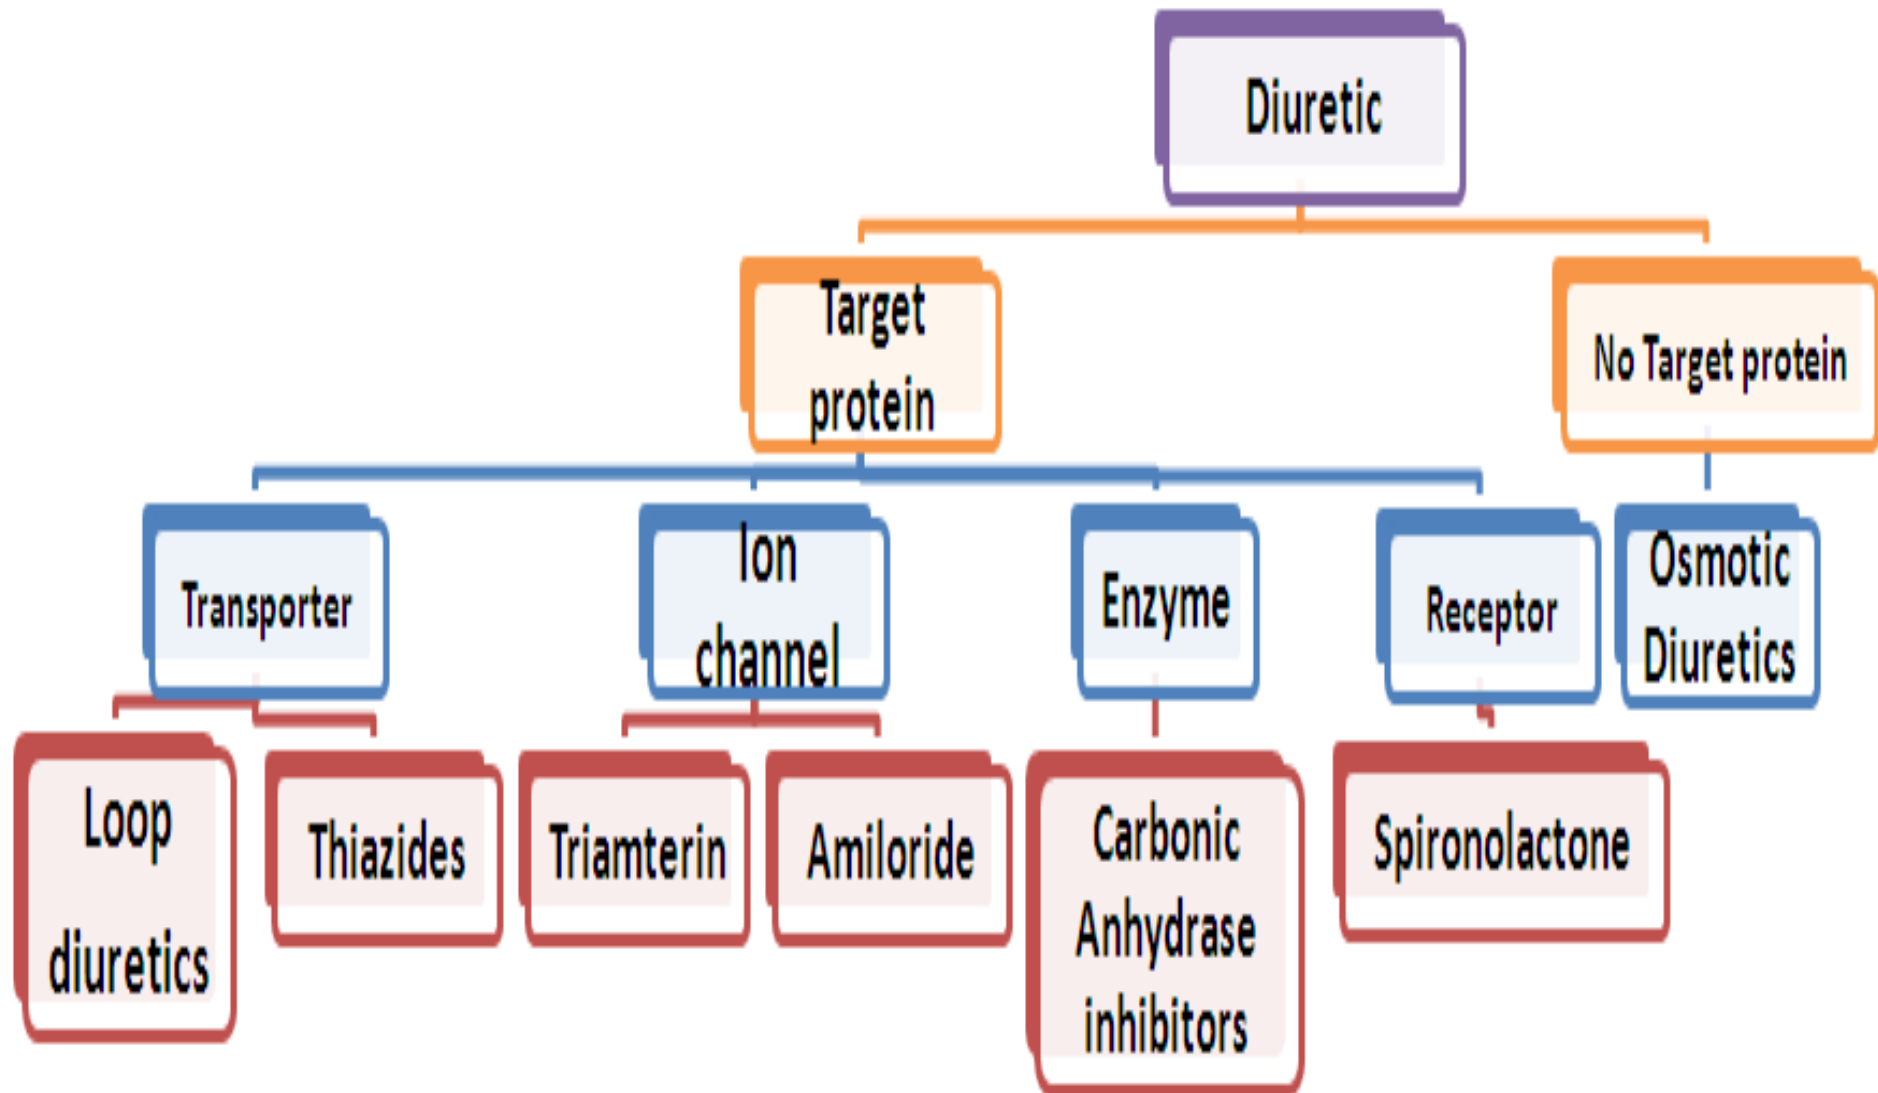

- **Carbonic anhydrase inhibitors**
- **Loop diuretics**
- **Thiazide diuretics**
- **Potassium-sparing diuretics**
- **Osmotic diuretics**

**Thiazides**

**Low efficacy**

**K<sup>+</sup> sparing**

**Spironolactone  
Triamterin  
Amiloride**

**Osmotic**

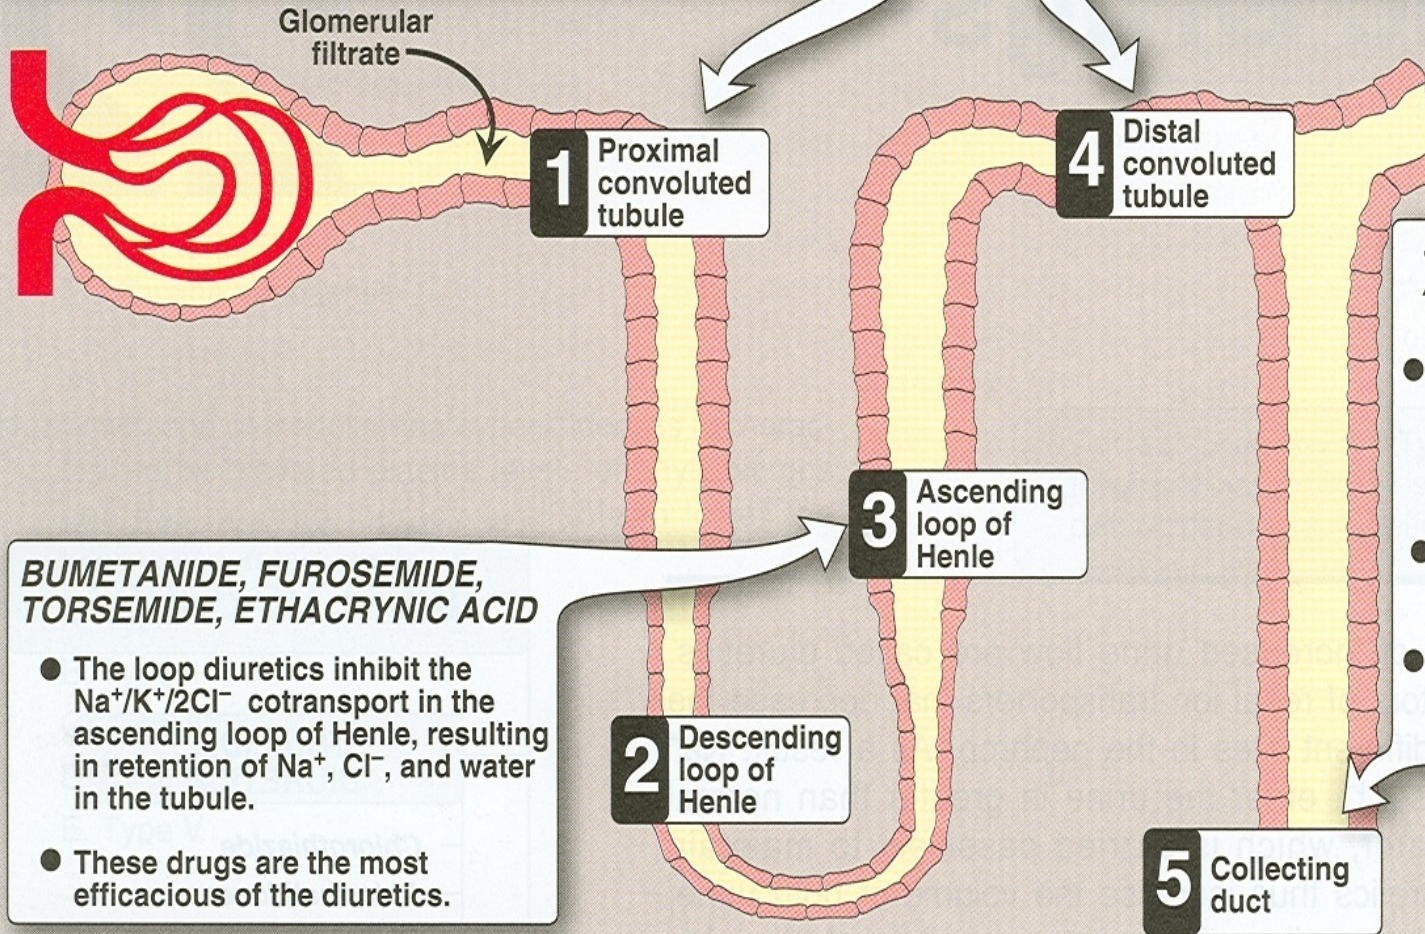

**Carbonic anhydrase inhibitors**

## ACETAZOLAMIDE

- A carbonic anhydrase inhibitor that inhibits the reabsorption of  $\text{HCO}_3^-$  in the proximal convoluted tubule.
- Weak diuretic properties.

## THIAZIDES

- Inhibit reabsorption of  $\text{Na}^+$  and  $\text{Cl}^-$  in the distal convoluted tubule, resulting in retention of water.
- Most commonly used diuretics.

## BUMETANIDE, FUROSEMIDE, TORSEMIDE, ETHACRYNIC ACID

- The loop diuretics inhibit the  $\text{Na}^+/\text{K}^+/\text{2Cl}^-$  cotransport in the ascending loop of Henle, resulting in retention of  $\text{Na}^+$ ,  $\text{Cl}^-$ , and water in the tubule.
- These drugs are the most efficacious of the diuretics.

## SPIRONOLACTONE, AMILORIDE, TRIAMTERENE

- *Spironolactone*, an aldosterone antagonist, inhibits the aldosterone-mediated reabsorption of  $\text{Na}^+$  and secretion of  $\text{K}^+$ .
- *Amiloride* and *triamterene* block  $\text{Na}^+$  channels.
- These agents can prevent loss of  $\text{K}^+$  that occurs with thiazide or loop diuretics.

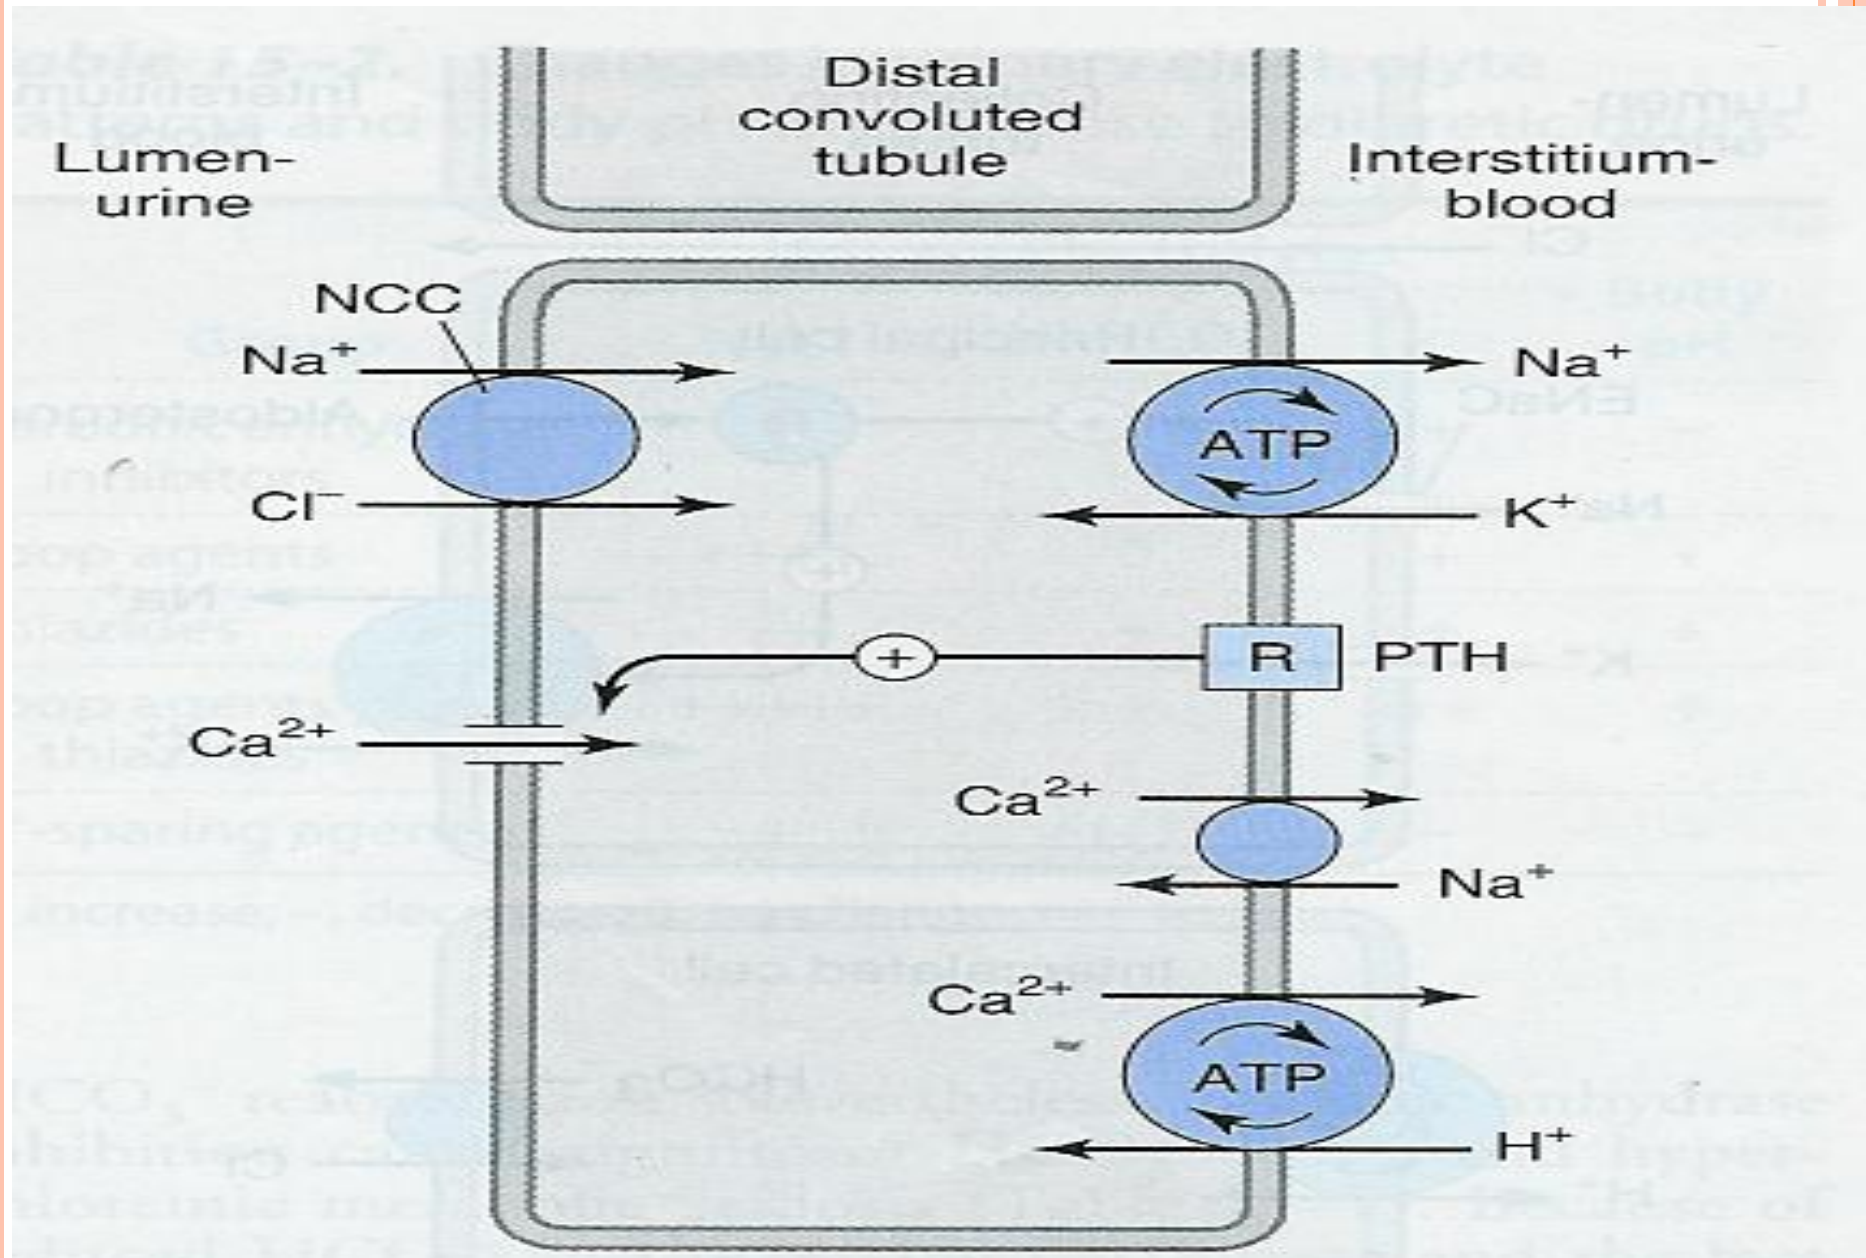

Major locations of ion and water exchange in the nephron, showing sites of action of the diuretic drugs.

# ASCENDING LOOP OF HENLE

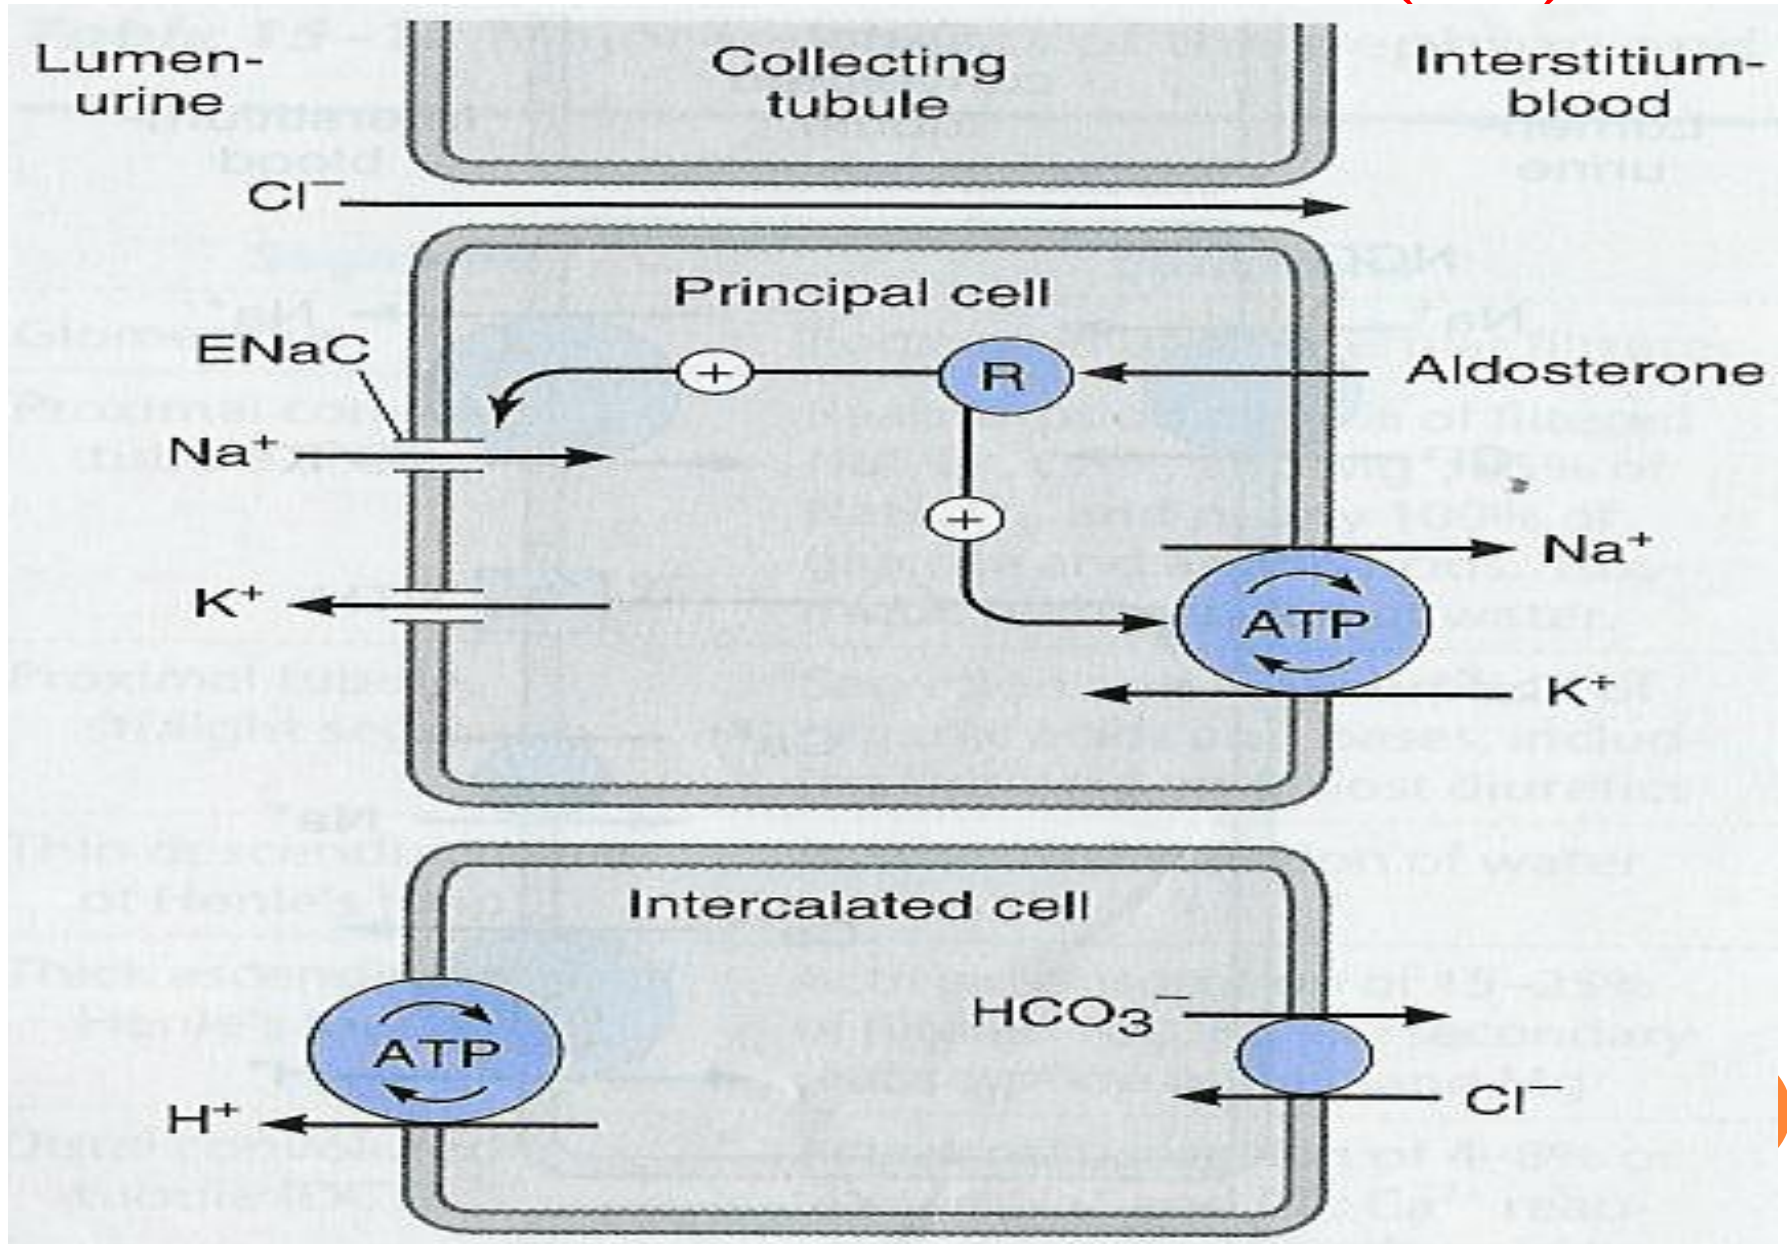

# Distal convoluted tubules (DCT)

# COLLECTING TUBULES (CT)

# COLLECTING TUBULES (CT)

# **Carbonic Anhydrase Inhibitors**

# Carbonic Anhydrase Inhibitors

**Drugs: Acetazolamide – dorzolamide**

## **Mechanism of action:**

Inhibits **carbonic anhydrase (CA) enzyme** in proximal convoluted tubules thus interferes with **NaHCO<sub>3</sub> re-absorption** and causes diuresis.

# Carbonic Anhydrase Inhibitors

**Carbonic anhydrase** is required for reversible reaction in which

**Lumen**

**Blood**

**Basolateral membrane**

**Luminal membrane**

**Proximal tubules**

# Pharmacokinetics of acetazolamide:

- given orally once a day.
- Onset of action is rapid (30 min).
- Duration of action (9-12 h).
- Excreted by active secretion in proximal convoluted tubules.
- Produces **alkaline urine**

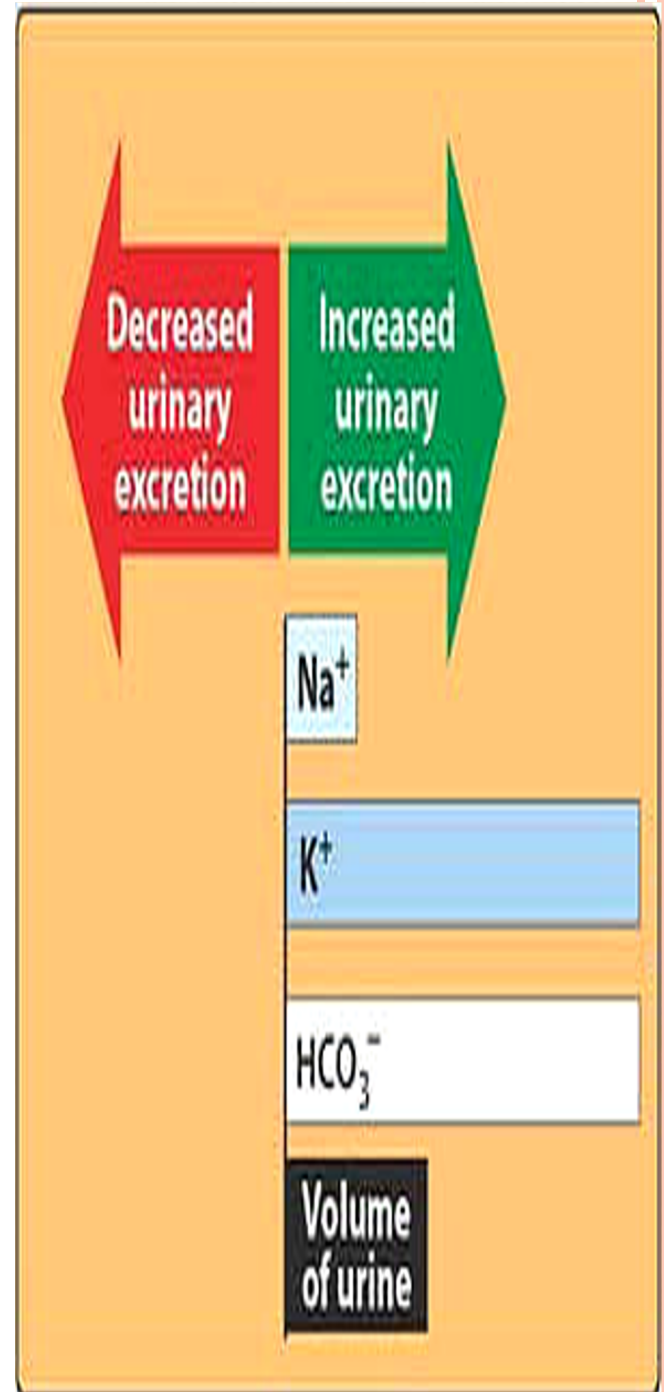

## Pharmacological actions:

- **↑ Mild increase in urine volume**
- **↑ urinary excretion of sodium, potassium , bicarbonate (alkaline urine).**
- **Metabolic acidosis.**
- **↑ Urinary phosphate excretion.**
- **Promotes  $K^+$  excretion by ↑the load of  $Na^+$  delivered to the distal tubules.**

# Why do CA inhibitors have weak diuretic properties?

**Diuretic properties decreases after several days as the blood bicarbonate falls.**

# Dorzolamide

- Is a carbonic anhydrase inhibitor
- Used topically for treatment of open-angle glaucoma.
- no diuretic or systemic side effects (Why?)

# Therapeutic uses:

- **Open angle glaucoma**

**carbonic anhydrase inhibitors decrease aqueous humour formation and ↓ IOP by reducing aqueous humor formation in ciliary body of eye.**

- **As prophylactic therapy, in acute mountain sickness ↓ CSF of brain**

given nightly 5 days before the ascent ↓ weakness, breathlessness, dizziness, nausea, cerebral & pulmonary oedema.

**IOP:** Intraocular pressure; **CSF:** Cerebrospinal fluid

# Therapeutic uses:

- **Formation of CSF:**

(↓ of carbonic anhydrase in the choroid plexus → ↓ formation of CSF. Useful in treating benign intracranial hypertension).

- **Urinary alkalization to enhance renal excretion of acidic substances (uric acid, methotrexate and cysteine in cystinuria).**

- **Hyperphosphatemia**

## Therapeutic uses:

### Adjunct for treatment of epilepsy:

Glial cells contain carbonic anhydrase. Nerves are highly responsive to rise in pH 7.4 → 7.8 causes convulsions. ↓ neuronal carbonic anhydrase → ↓ pH in the vicinity of neurons → ↓ convulsions.

### Metabolic alkalosis

Useful for correcting a metabolic alkalosis, especially an alkalosis caused by diuretic-induced increases in  $H^+$  excretion & metabolic alkalosis of heart failure.

## **Adverse effects:**

- **Hypokalemia (potassium loss).**
- **Metabolic acidosis.**
- **Renal stone formation (calcium phosphate stones).**
- **Hypersensitivity reaction.**

# Osmotic diuretics

# Osmotic diuretics

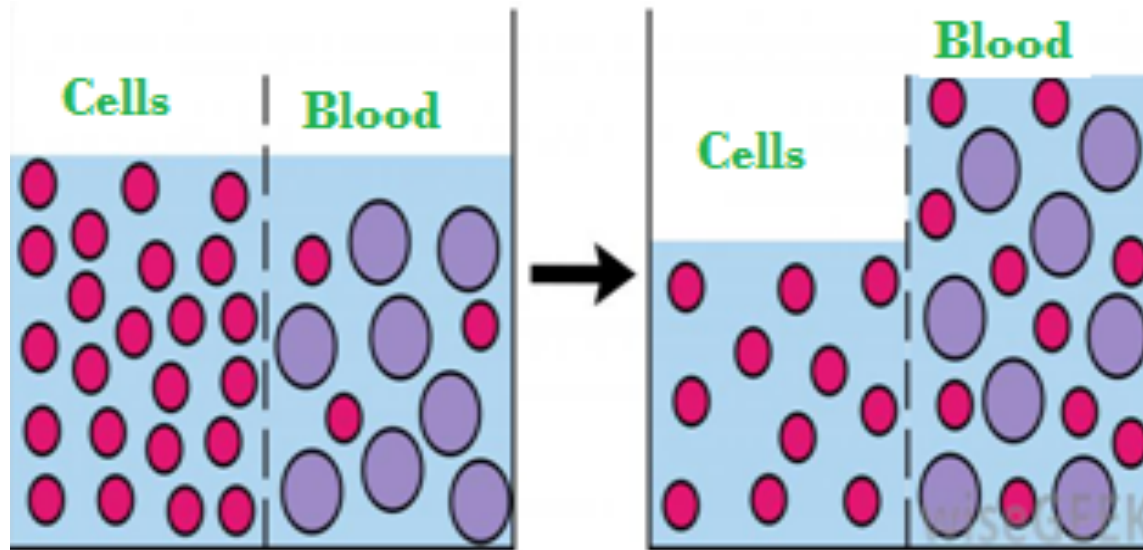

## Mannitol:

- Poorly absorbed
- If given orally  $\longrightarrow$  osmotic diarrhea
- Given intravenously
- Not metabolized
- Excreted by glomerular filtration **without being re-absorbed or secreted within 30-60 min**

# Mannitol

- Acts in proximal tubules & descending loop of Henle by **osmotic effect**.
- Mannitol increases urine output by osmosis, drawing water out of cells and into the blood stream.

- **IV administration of mannitol exert an osmotic pressure → ↓water & Na<sup>+</sup> reabsorption.**
- ↑water excretion with relatively less effect on Na<sup>+</sup>.
- **Expand the extracellular fluid volume, decrease blood viscosity, and inhibit renin release, ↑renal blood flow.**

## Therapeutic Uses:

- **Acute renal failure due to shock or trauma** (maintain urine flow- preserve kidney function).
- To maintain urine volume & prevent anuria resulting from large pigmentation load to the kidney e.g. **haemolysis, rhabdomyolysis**
- **In acute drug poisoning:** To eliminate drugs that are reabsorbed from the renal tubules e.g. salicylates, barbiturates.
- To ↓ intracranial & intraocular pressure before ophthalmic or brain procedures (**cerebral edema**).

## **Adverse Effects:**

- **Headache, nausea, vomiting**
- **Extracellular volume expansion,** complicates heart failure & pulmonary oedema
- ✚ **Excessive use**→ dehydration & hypernatraemia (Adequate water replacement is required).

## **Contraindication:**

- ✚ Chronic heart failure
