

# Management of Urinary Tract Infections

Dr. Khalifa Binkhamis & Prof.Hanan Habib Pathology Department

# **Objectives**

1 – Recall the principal goal of management of urinary tract infection (UTI) and that antibiotics are the main treatment of UTI

2- Discuss the factors that management of UTI depends on

3- Describe the management/treatment of different conditions of UTI (cystitis, pyelonephritis, catheter associated UTI, etc.)

# **Goal of Management of UTI**

The principal goal of management of UTI is to eradicate the offending organisms from the urinary bladder and tissues.

The main treatment of UTI is by antibiotics.

## Management of UTI depends on:

- Whether infection is complicated or uncomplicated.
- Whether infection is primary or recurrent.
- Type of patient (pregnant ,child , hospitalized or not, diabetic patient,.....etc)
- Bacterial count.
- Presence of symptoms.

## Uncomplicated UTI

Low-risk patient (woman) for recurrent infection:

- 3 days antibiotic without urine test.
- Cure rate 94%.
- Choice of antibiotic depend on susceptibility pattern of bacteria, it includes ;
- Amoxicillin ( with or without clavulanic acid) Cephlosporins ( first or second generation)

Fluoroquinolone (ciprofloxacin or norfloxacin) (not for pregnant women or children under 18 year), first choice if other antibiotics are resistant.

TMP-SMX (trade names: Bactrim, Septra ,Cotrimoxazole)

Nitrofurantoin (for long term use)

# **Relapsing infection**

Caused by treatment failure or structural abnormalities or abscesses.

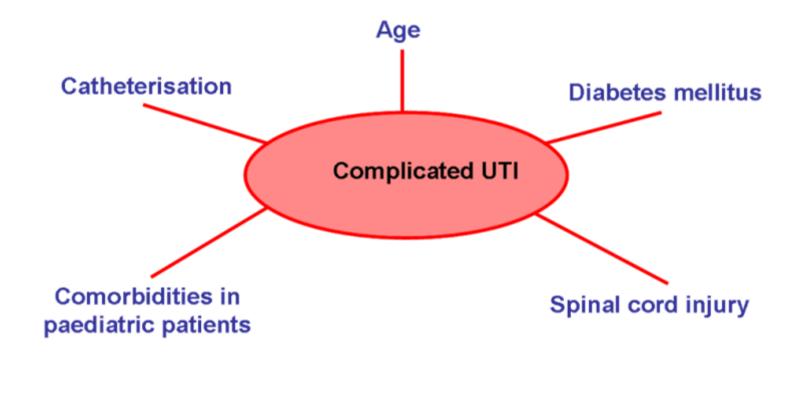

Antibiotics used at the initial infection

Treatment for 7-14 days.

## **Recurrent infections**

Patients with two or more symptomatic UTIs within 6 months or 3 or more over a year.
Need preventive therapy
Antibiotic taken as soon as symptoms develop.

If infection occurs less than twice a year, a clean catch urine test should be taken for culture and treated as initial attack for 3 days.

# When to consult the doctor?

- If symptoms persist
- A change in symptoms
- Pregnant women
- More than 4 infections per year
- Impaired immune system
- Previous kidney infections
- Structural abnormalities of urinary tract
- History of infection with antibiotic resistant bacteria.

# **Prophylactic antibiotics**

- Optional for patients who do not respond to other measures.
- Reduces recurrence by up to 95%
- Low dose antibiotic taken continuously for 6 months or longer, it includes :
- TMP-SMX, Nitrofurantoin, or Cephalexin
- Antibiotic taken at bed time more effective.

# Uncomplicated pyelonephritis

- Patients with fever, chills and flank pain but they are healthy, non-pregnant, female, without relevant comorbidities and without structural or functional urinary tract abnormalities
- Can be treated at home with oral antibiotics for 14 days with one of the followings:
   Cephalosporins, Amoxicillin–Clavulanic acid, Ciprofloxacin or TMP–SMX.

First dose may be given by injection

### Moderate to sever pyelonephritis

#### Patients need hospitalization

- Antibiotic given by IV route for 3-5 days until symptoms relieved for 24-48 hrs.
- If fever and back pain continue after 72 hrs of antibiotic, imaging tests indicated to exclude abscesses, obstruction or other abnormality.

## **Treatment of specific populations**

#### Pregnant women

- High risk for UTI and complications
- Should be screened for UTI
- Antibiotics during pregnancy includes;;
- Amoxicillin, Ampicillin, Cephalosporins, and Nitrofurantoin.
- Pregnant women should NOT take Quinolones.

- Pregnant women with asymptomatic bacteriuria (evidence of infection but no symptoms) have 30% risk for acute pyelonephritis in the second or third trimester. Screening and 3–7 days antibiotic needed.
- Acute cystitis during pregnancy usually treated within 7 days of abx

## **Diabetic patients**

- Have more frequent and more sever UTIs.
- Treated for 7-14 days with antibiotics even patients with uncomplicated infections.

## Urethritis in men

- Most important causes:
  - Neisseria gonorrheae
  - Chlamydia trachomatis
- Treated with IM Ceftriaxone + Doxycycline or Azithromycin.
- Patients should also be tested for accompanying STD.

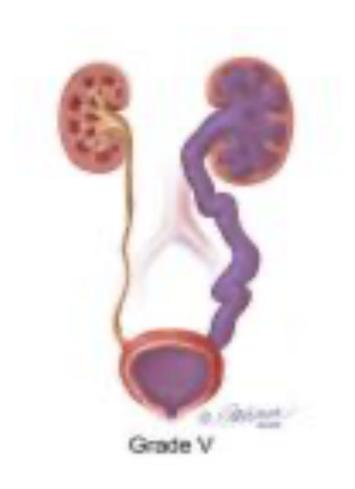

# Children with UTI

- Usually treated with TMP-SMX or Cephalexin.
- Sometimes given as IV .
- Gentamicin may be recommended as resistance to Cephalexin is increasing.

## Vesicoureteric reflux (VUR)

- Common in children with UTI
- Can lead to pyelonephritis and kidney damage.
- Long-term antibiotic plus surgery used to correct VUR and prevent infections.
- Acute kidney infection : use Cefixime (oral) or IV Ceftriaxone or Gentamicin a one daily dose for 2-4 days followed by oral treatment eg. amoxicillin-clavulanic acid or TMP-SMX.

# Management of catheter-induced UTI

- Very common
- Preventive measures important
- Catheter should not be used unless absolutely necessary and they should be removed as soon as possible.

## Urinary catheter

# Intermittent use of catheters

- If catheter is required for long periods ,it is best to be used intermittently.
- May be replaced every 2 weeks to reduce risk of infection and irrigating bladder with antibiotics between replacements
- Daily hygiene and use of closed system to prevent infection.

# Catheter induced infections

- Catheterized patients who develop UTI with symptoms or at risk for sepsis should be treated for each episode with antibiotics and catheter should be removed, if possible.
- Associated organisms are constantly changing.
- May be multiple species of bacteria.

## continue-

- Antibiotic use for prophylaxis is rarely recommended since high bacterial counts present and patients do not develop symptomatic UTI.
- ANTIBIOTIC THERAPY HAS LITTLE BENEFIT IF THE CATHETER IS TO REMAIN IN PLACE FOR LONG PERIOD.
