

# Physiology of Autonomic Nervous System

**Fawzia Al-Rouq**

**Consultant and head of clinical physiology  
unit KAUH**

**Department of Physiology**

**College of Medicine**

**King Saud University**

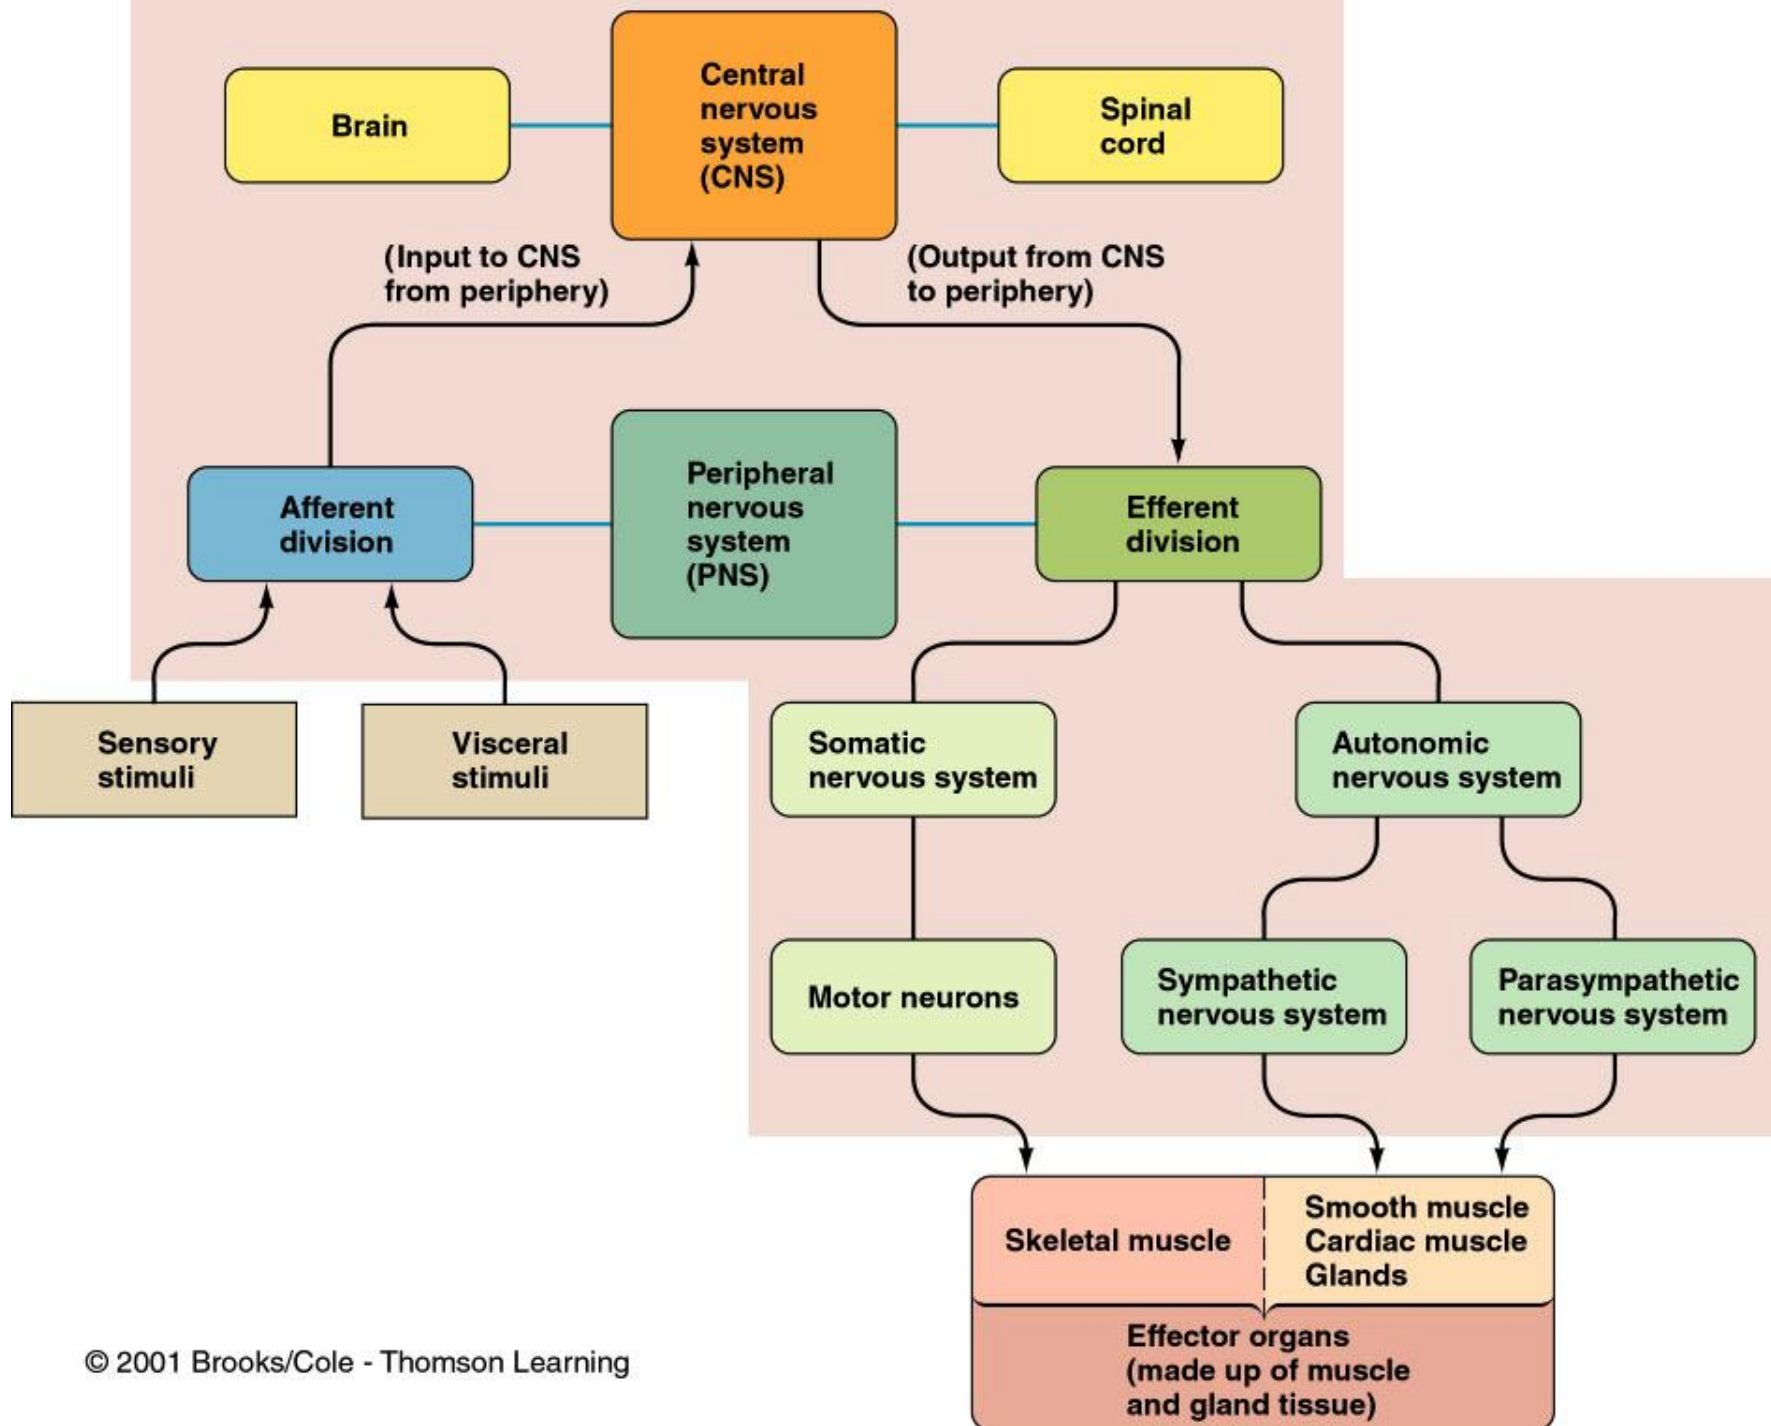

# INTRODUCTION

# THE NERVOUS SYSTEM

## •INTRODUCTION

- The nervous system monitors and controls almost every organ / system through a series of positive and negative feedback loops.
- The Central Nervous System (CNS): Includes the brain and spinal cord.
- The Peripheral Nervous System (PNS): Formed by neurons & their process present in all the regions of the body.
- It consists of cranial nerves arises from the brain & spinal nerves arising from the spinal cord.
- The peripheral NS is divided into
  - Somatic Nervous system
  - Autonomic nervous system

# Functional Anatomy & Physiology of Autonomic NS

# OBJECTIVES

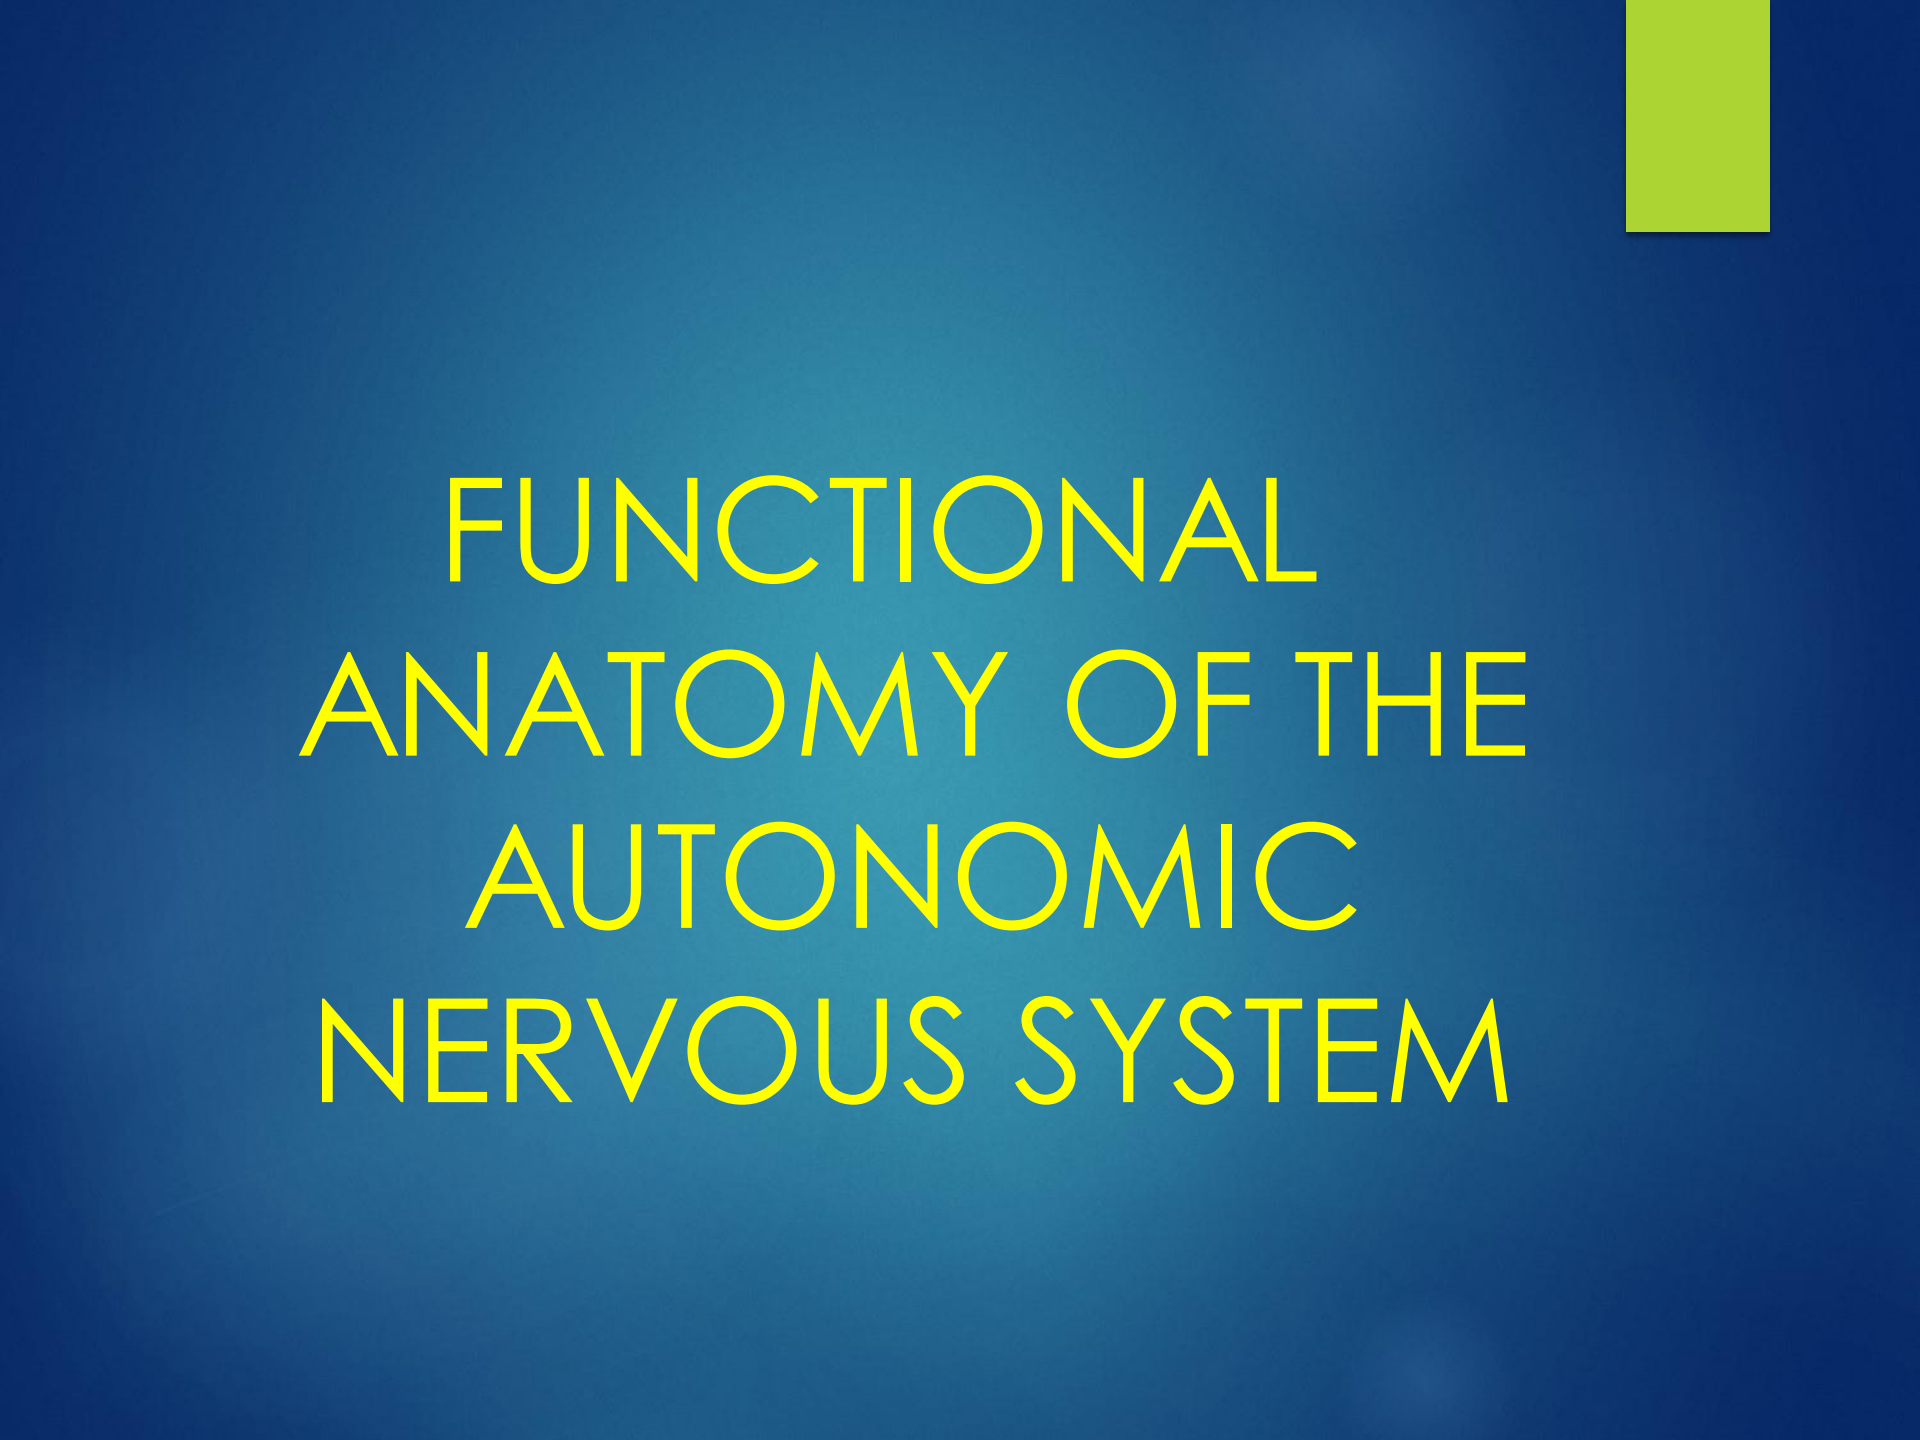

# ▶ Anatomy and physiology of Autonomic Nervous System

▶ At the end of this lecture the student should be able to:-

▶ -appreciate the anatomy of sympathetic & parasympathetic nervous system.

▶ -explain physiological functions of Sympathetic & parasympathetic nerves in head & neck, chest, abdomen and pelvis

# FUNCTIONAL ANATOMY OF THE AUTONOMIC NERVOUS SYSTEM

# Basic anatomical difference between the motor pathways of the voluntary somatic nervous system (to skeletal muscles) and those of the autonomic nervous system

*Basic anatomical difference between the motor pathways of the voluntary somatic nervous system (to skeletal muscles) and those of the autonomic nervous system*

10

- ▶ Somatic division:
  - ▶ Cell bodies of motor neurons reside in CNS (brain or spinal cord)
  - ▶ Their axons (sheathed in spinal nerves) extend all the way to their skeletal muscles
- ▶ Autonomic system: chains of two motor neurons
  - ▶ 1<sup>st</sup> = preganglionic neuron (in brain or cord)
  - ▶ 2<sup>nd</sup> = ganglionic neuron (cell body in ganglion outside CNS)
  - ▶ Slower because lightly or unmyelinated

- ▶ ANS is the subdivision of the peripheral nervous system that regulates body activities that are generally ***not under conscious control***
- ▶ ***Visceral motor*** innervates ***non-skeletal (non-somatic) muscles***
- ▶ Composed of a special group of neurons serving:
  - ▶ Cardiac muscle (the heart)
  - ▶ Smooth muscle (walls of viscera and blood vessels)
  - ▶ Internal organs
  - ▶ Skin

- ▶ Axon of 1<sup>st</sup> (*preganglionic*) neuron leaves CNS to synapse with the 2<sup>nd</sup> (*ganglionic*) neuron
- ▶ Axon of 2<sup>nd</sup> (*ganglionic*) neuron extends to the organ it serves

# LOCATIONS OF AUTONOMIC GANGLIA

## Sympathetic Ganglia

### Location

□ Trunk (chain) ganglia near vertebral bodies

□ Prevertebral ganglia near large blood vessel in gut :celiac ,superior mesenteric & inferior mesenteric

# Parasympathetic Ganglia

## Location :

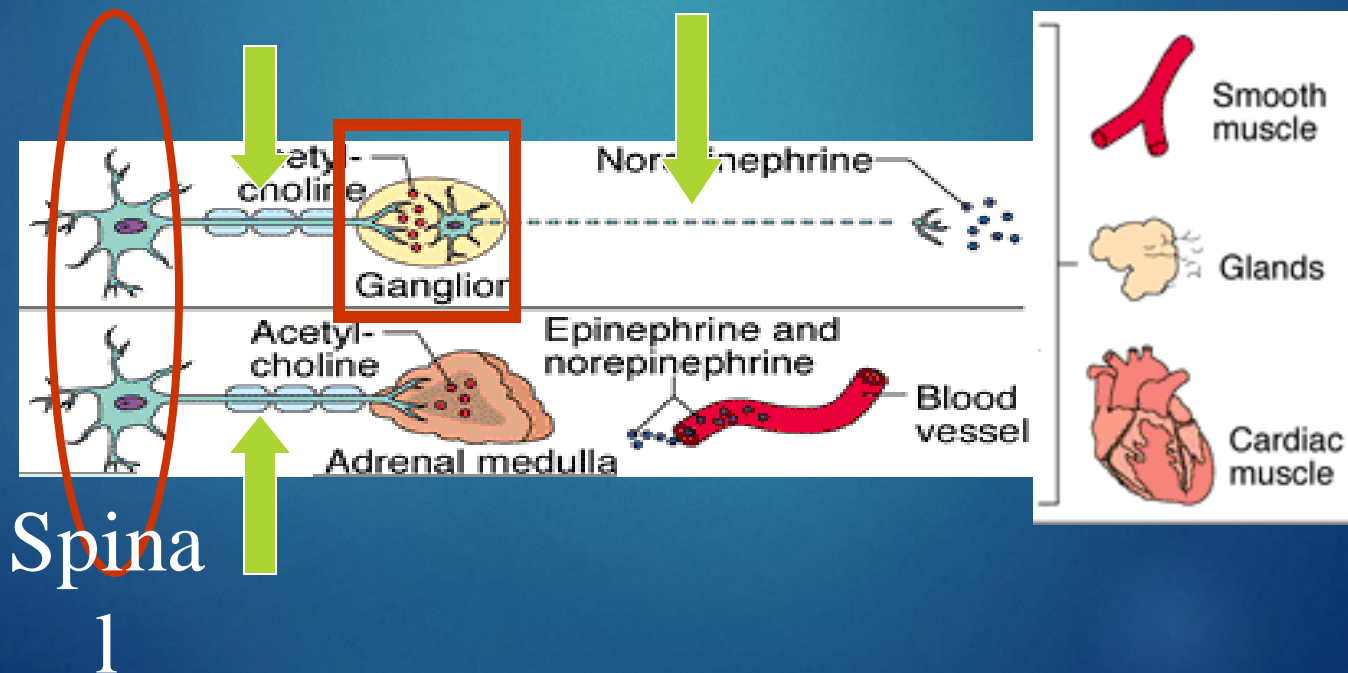

- ▶ Terminal ganglia
- ▶ in the wall of organ

# Sympathetic

## Innervation of Visceral Targets

- Short, lightly myelinated preganglionic neurons
- Long, unmyelinated postganglionic neurons
- ▶ **Ganglia close to spinal cord**

# Parasympathetic Innervation of Visceral Targets

- ▶ Ganglia close to or on target organs
- Preganglionic neurons - long
- Post ganglionic neurons - short

# SYMPATHETIC & PARASYMPATHETIC NERVOUS SYSTEM ORIGIN

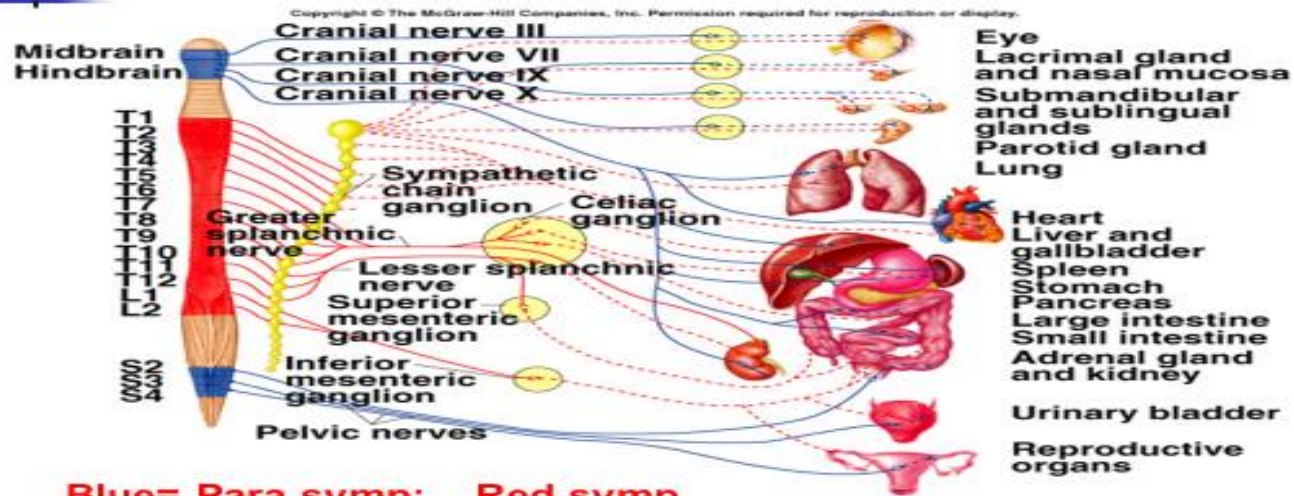

**Parasympathetic: Craniosacral:** Originate from cranial nerves (3<sup>rd</sup>, 7<sup>th</sup>, 9<sup>th</sup>, 10<sup>th</sup>), and sacral spinal nerves S2,3,4  
**Sympathetic: Thoracolumbar:** Originate in the thoracic & lumbar regions of the spinal cord (T1-T12; L1-L2,3)

**Blue= Para symp; Red symp**

# Sympathetic - Origin

- ▶ Thoracolumbar lateral horns of the spinal segments T1-L2.
- ▶ Nerve fibers originate between T1 & L2

Parasympathetic: Craniosacral: Originate from cranial nerves (3<sup>rd</sup>, 7<sup>th</sup>, 9<sup>th</sup>, 10<sup>th</sup>), and sacral spinal nerves S2,3,4  
Sympathetic: Thoracolumbar: Originate in the thoracic & lumbar regions of the spinal cord (T1-T12; L1-L2,3)

# Parasympathetic - Origin

- ❑ Craniosacral Cell bodies of the motor nuclei of the cranial nerves III, VII, IX and X in the brain stem
- ❑ Second, third and fourth [S2-S4] sacral segments of the spinal cord
- ▶ Nerve fibers emerge from brain &
- ▶ sacrum cranio-sacral outflow

# PARASYMPATHETIC NERVOUS SYSTEM

- ❑ The cranial nerves III, VII and IX affect the pupil and salivary gland secretion
- ❑ Vagus nerve (X) carries fibres to the heart, lungs, stomach, upper intestine and ureter
- ❑ The sacral fibres form pelvic plexuses which innervate the distal colon, rectum, bladder and reproductive organs.

# Autonomic Nervous System

- ▶ 2 divisions:

- ▶ Sympathetic

- ▶ “Fight or flight”
    - ▶ “E” division

- ▶ Exercise, excitement, emergency, and embarrassment

- ▶ Parasympathetic

- ▶ “Rest and digest”
    - ▶ “D” division

- ▶ Digestion, defecation, and diuresis

# SYMPATHETIC NERVOUS SYSTEM FUNCTIONS

## FEAR, FLIGHT OR FIGHT

- ❑ The sympathetic system enables the body to be prepared for fear, flight or fight
- ❑ Sympathetic responses include an increase in heart rate, blood pressure and cardiac output
- ❑ Diversion of blood flow from the skin and splanchnic vessels to those supplying skeletal muscle
- ❑ Increased pupil size, bronchiolar dilation, contraction of sphincters and metabolic changes such as the mobilisation of fat and glycogen.

# **FUNCTIONS OF SYMPATHETIC NERVOUS SYSTEM**

**Bronchioles dilate, which allows for greater alveolar oxygen exchange.**

**It increases heart rate and the contractility of cardiac cells (myocytes), thereby providing a mechanism for the enhanced blood flow to skeletal muscles.**

**Sympathetic nerves dilate the pupil and relax the lens, allowing more light to enter the eye.**

# PARASYMPATHETIC NERVOUS SYSTEM FUNCTIONS

- ❑ The parasympathetic nervous system has "rest and digest" activity.
- ❑ In physiological terms, the parasympathetic system is concerned with conservation and restoration of energy, as it causes a reduction in heart rate and blood pressure, and facilitates digestion and absorption of nutrients, and consequently the excretion of waste products
- ❑ The chemical transmitter at both pre and postganglionic synapses in the parasympathetic system is Acetylcholine (Ach).

# THE AUTONOMIC NERVOUS SYSTEM

| <b>Subdivision</b>     | <b>Nerves Employed</b> | <b>Location of Ganglia</b>          | <b>Chemical Messenger</b> | <b>General Function</b>            |
|------------------------|------------------------|-------------------------------------|---------------------------|------------------------------------|
| <b>Sympathetic</b>     | <b>Thoracolumbar</b>   | <b>Alongside vertebral column</b>   | <b>Norepinephrine</b>     | <b>Fight or flight</b>             |
| <b>Parasympathetic</b> | <b>Craniosacral</b>    | <b>On or near an effector organ</b> | <b>Acetylcholine</b>      | <b>Conservation of body energy</b> |

# PHYSIOLOGICAL FUNCTIONS OF THE AUTONOMIC NERVOUS SYSTEM

# The Autonomic Nervous System

| <b>Structure</b>         | <b>Sympathetic Stimulation</b>        | <b>Parasympathetic Stimulation</b>    |
|--------------------------|---------------------------------------|---------------------------------------|
| <b>Iris (eye muscle)</b> | <b>Pupil dilation</b>                 | <b>Pupil constriction</b>             |
| <b>Salivary Glands</b>   | <b>Saliva production reduced</b>      | <b>Saliva production increased</b>    |
| <b>Oral/Nasal Mucosa</b> | <b>Mucus production reduced</b>       | <b>Mucus production increased</b>     |
| <b>Heart</b>             | <b>Heart rate and force increased</b> | <b>Heart rate and force decreased</b> |
| <b>Lung</b>              | <b>Bronchial muscle relaxed</b>       | <b>Bronchial muscle contracted</b>    |

# The Autonomic Nervous System

| <b>Structure</b>       | <b>Sympathetic Stimulation</b>              | <b>Parasympathetic Stimulation</b>         |
|------------------------|---|--|
| <b>Stomach</b>         | Peristalsis reduced                         | Gastric juice secreted; motility increased |
| <b>Small Intes</b>     | Motility reduced                            | Digestion increased                        |
| <b>Large Intes</b>     | Motility reduced                            | Secretions and motility increased          |
| <b>Liver</b>           | Increased conversion of glycogen to glucose |  |
| <b>Kidney</b>          | Decreased urine secretion                   | Increased urine secretion                  |
| <b>Adrenal medulla</b> | Norepinephrine and epinephrine secreted     |  |
| <b>Bladder</b>         | Wall relaxed<br>Sphincter closed            | Wall contracted<br>Sphincter relaxed       |

# MECHANISM OF ACTIONS

The neurotransmitters  
& receptors of  
Autonomic NS

# OBJECTIVES

- ▶ describe neurotransmitters that can release at pre and post ganglionic of Autonomic NS.
- ▶ Describe Autonomic NS receptors.

# Sympathetic Neurotransmitters

- ▶ Cholinergic = ( release acetylcholine )
- ▶ Postganglionic neurons:
  - ▶ release norepinephrine at target organs
  - ▶ ie. Adrenergic

# Parasympathetic Neurotransmitters

- Pre & Postganglionic neurons release acetylcholine = Cholinergic

# ANS Neurotransmitters: Classified as either cholinergic or adrenergic neurons based upon the neurotransmitter released

# Chemical or neural transmitter

- ▶ All **preganglionic** fibers release **acetylcholin (Ach)**.
- ▶ All **parasympathetic postganglionic** release **Ach**.
- ▶ All **sympathetic postganglionic** release **noradrenalin except sweat glands & bl vessels to skeletal muscles**

# RECEPTORS

- ❑ The parasympathetic nervous system uses only acetylcholine (ACh) as its neurotransmitter.
- ❑ The ACh acts on two types of receptors, the muscarinic and nicotinic cholinergic receptors.
- ❑ Most transmissions occur in two stages: When stimulated, the preganglionic nerve releases ACh at the ganglion, which acts on nicotinic receptors of the postganglionic nerve.
- ❑ The postganglionic nerve then releases ACh to stimulate the muscarinic receptors of the target organ.

**ANS Receptors :** Classified as either parasympathetic or sympathetic

**The Sympathetic NS Acts on two types of receptors**

**:  $\alpha$  and  $\beta$ .**

**What do the receptors do?**

**Activation of  $\alpha$  receptors leads to smooth muscle contraction**

**Activation of  $\beta_2$  receptors leads to smooth muscle relaxation**

**Activation of  $\beta_1$  receptors leads to smooth muscle contraction (especially in heart)**

THANK YOU
