# Transplantation

Immunology Unit
College of Medicine
King Saud University

# Objectives

- To understand the diversity among human leukocyte antigens (HLA) or major histo-compatibility complex (MHC)
- To know the role of HLA antigens in transplant rejection and graft versus host disease
- To be familiar with types of immune responses mediating transplant rejections and graft versus host disease and importance of tissue matching
- To understand the principles of management after transplantation

# Major Histocompatibility Complex and Transplantation

- Major histocompatibility complex (MHC) proteins were discovered for the first time with the advent of tissue transplantation
- The success of tissue and organ transplantation depends upon the donor's and recipient's "***human leukocyte antigens***" (HLA) encoded by HLA genes
- These proteins are allo-antigens

# MHC Class I and II Proteins

- MHC Class I are glycoproteins found on surface of virtually all the nucleated cells
  - Cytotoxic T cell kills virus infected cells in association with class I MHC proteins

- MHC Class II glycoproteins are normally found on the surface of antigen presenting cells (marophages, B cells, and dendritic cells)
  - Helper T cell recognize antigen in association with class II MHC proteins

# Major Histocompatibility Complex and Transplantation

- Genes for HLA proteins are clustered in the MHC complex located on the short arm of chromosome 6
- Three genes HLA-A, HLA-B and HLA-C code for Class I MHC proteins
- HLA-D loci encode for Class II MHC proteins ie, DP, DQ and DR

# Major Histocompatibility Complex and Transplantation

Each individual has two "***haplotypes***" i.e, two sets of these genes one paternal and one maternal

| MHC class | I | | | II | | | III | |
|---|---|---|---|---|---|---|---|---|
| Region | A | B | C | DP | DQ | DR | C4, C2, BF | |
| Gene products | HLA-A | HLA-B | HLA-C | DP | DQ | DR | C' proteins | TNF-α TNF-β |
| Polymorphisms | 47 | 88 | 29 | More than 300 HLA-D | | | | |

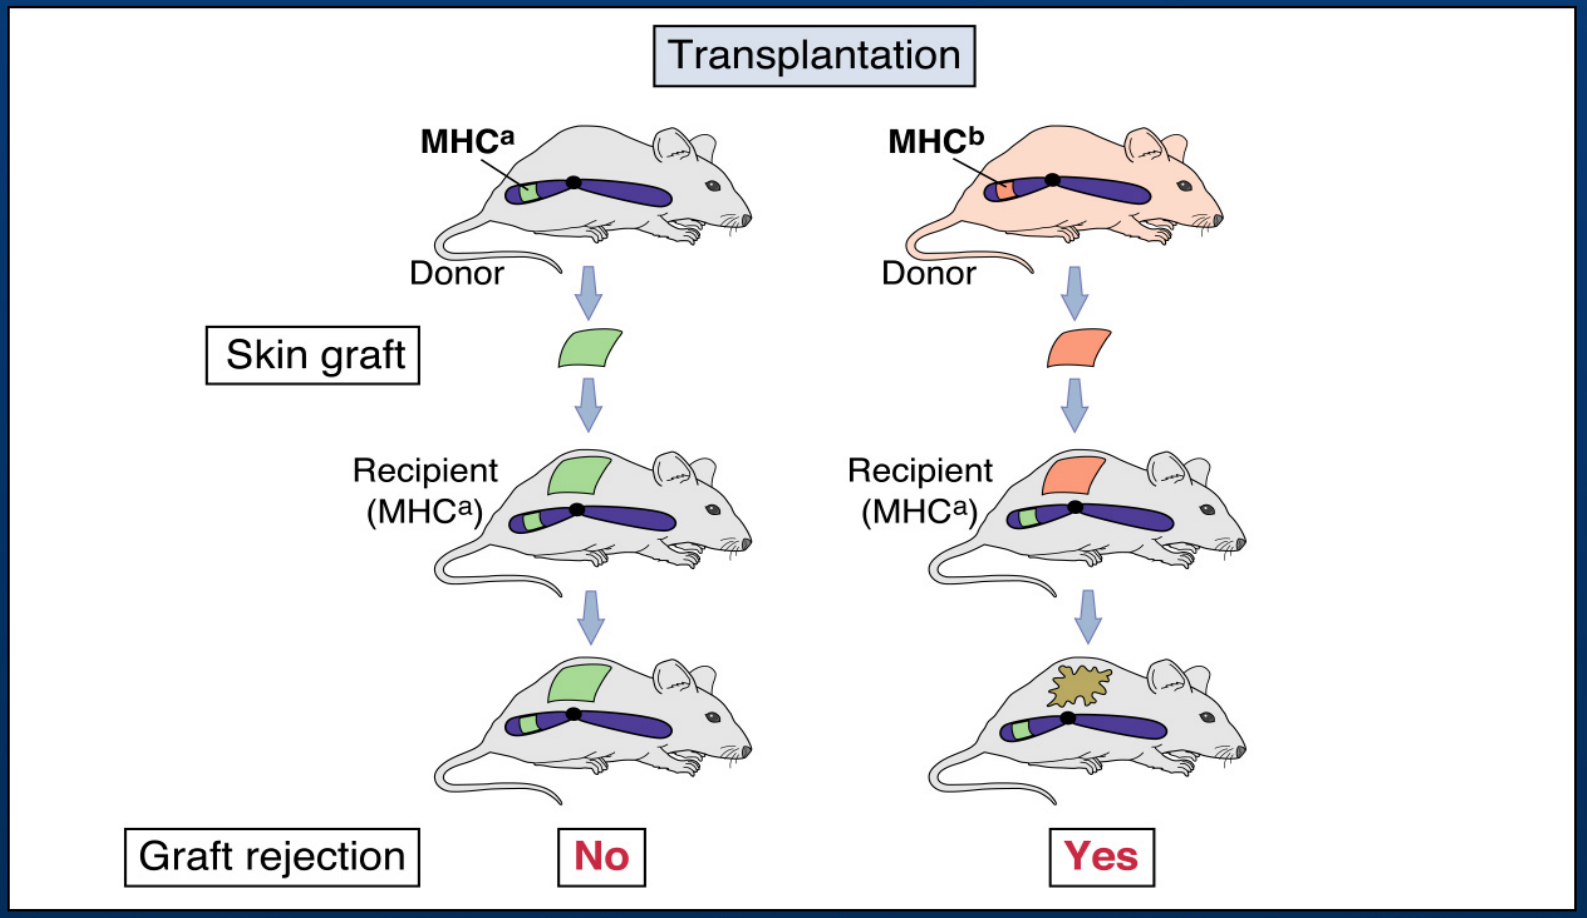
# Minor HLA genes and Transplantation

- Minor HLA genes – unknown
  - They mount a weak immune response
  - Play role in chronic rejection of a graft
  - There are no laboratory tests to detect minor antigens

# Transplantation antigens

Slide 4-2

## MHC alleles control allograft rejection



From Abbas, Lichtman, & Pober: Cellular and Molecular Immunology. W.B. Saunders, 1999, Fig. 4-2a

# Transplantation

- Types of transplants:
  - Autografts, Autologous grafts
    - Donor and recipient are same individual
    - Common in skin grafting; bone marrow
  - Syngeneic grafts or (isograft)
    - Donor and recipient are genetically identical
    - Animal models; identical twins

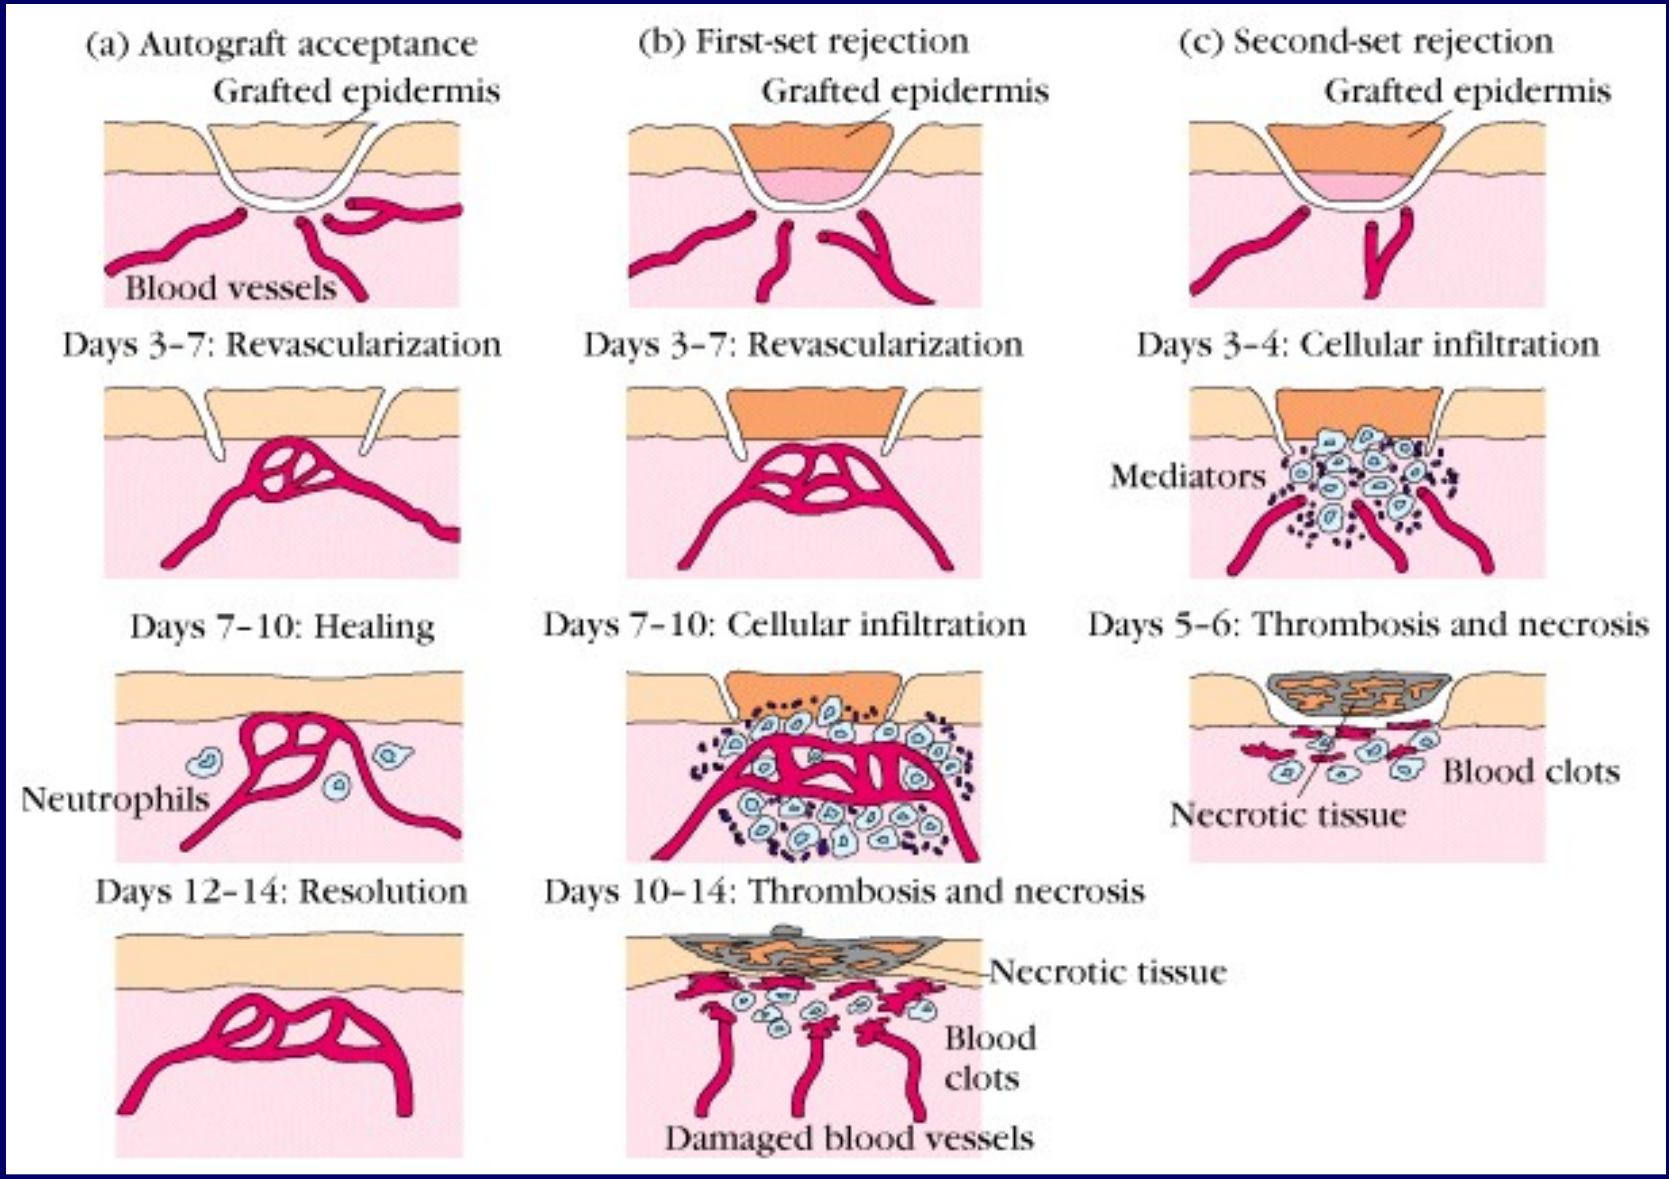
# Transplantation

- Types of transplants:
  - Allogeneic grafts
    - Donor and recipient are same species, but genetically unrelated
    - Common heart, lung, kidney, liver graft
  - Xenogeneic grafts
    - Donor and recipient are different species
  - Artificial grafts

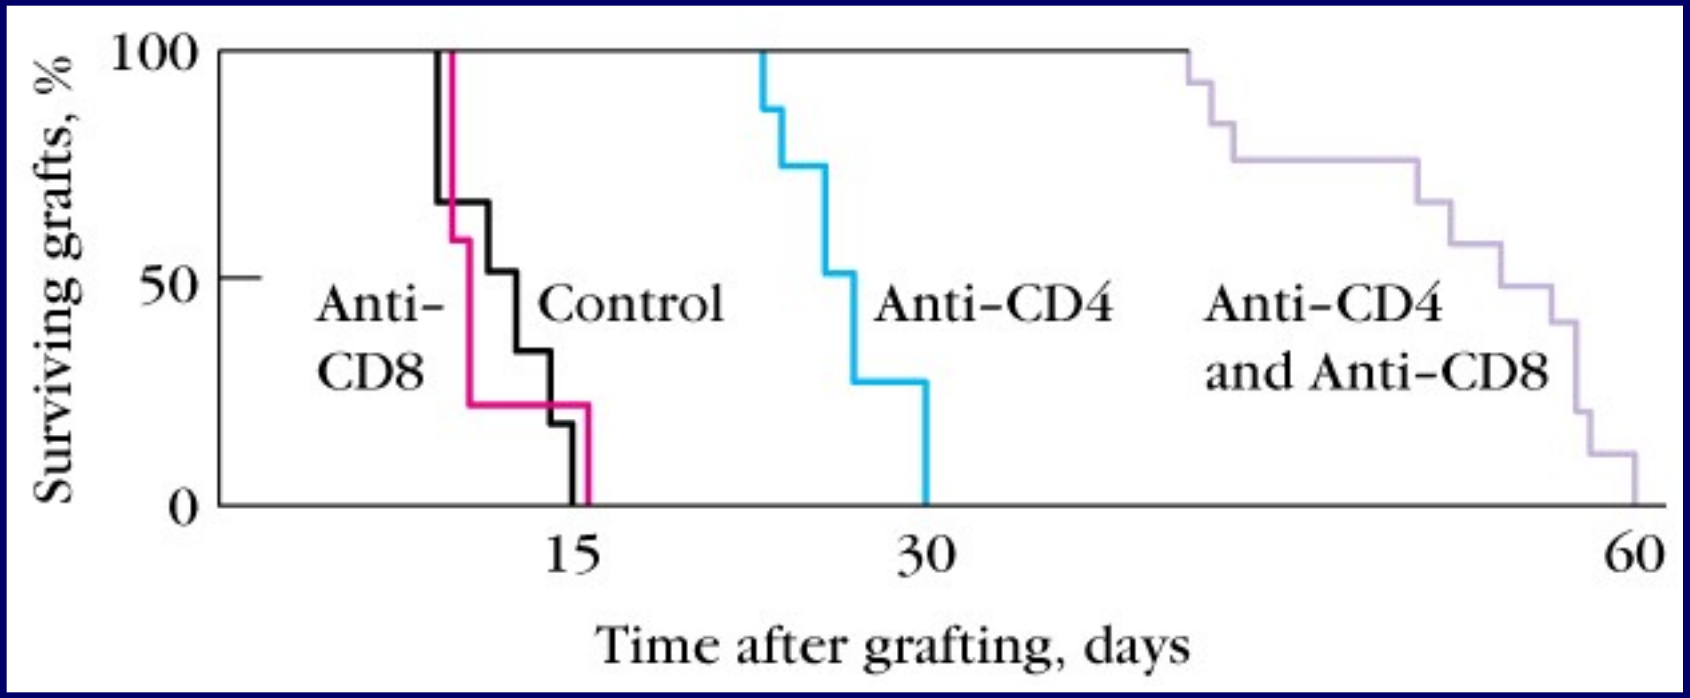
# Transplantation (Rejection)

- Major Barrier to transplantation is the immune response
  - T cells play primary role
  - B cells can/do play a role
  - Classic adaptive/acquired immune response
    - Memory
    - Specificity

# 1st set versus 2nd set reactions



# Role of $CD4^+$ versus $CD8\ T^+$ cells



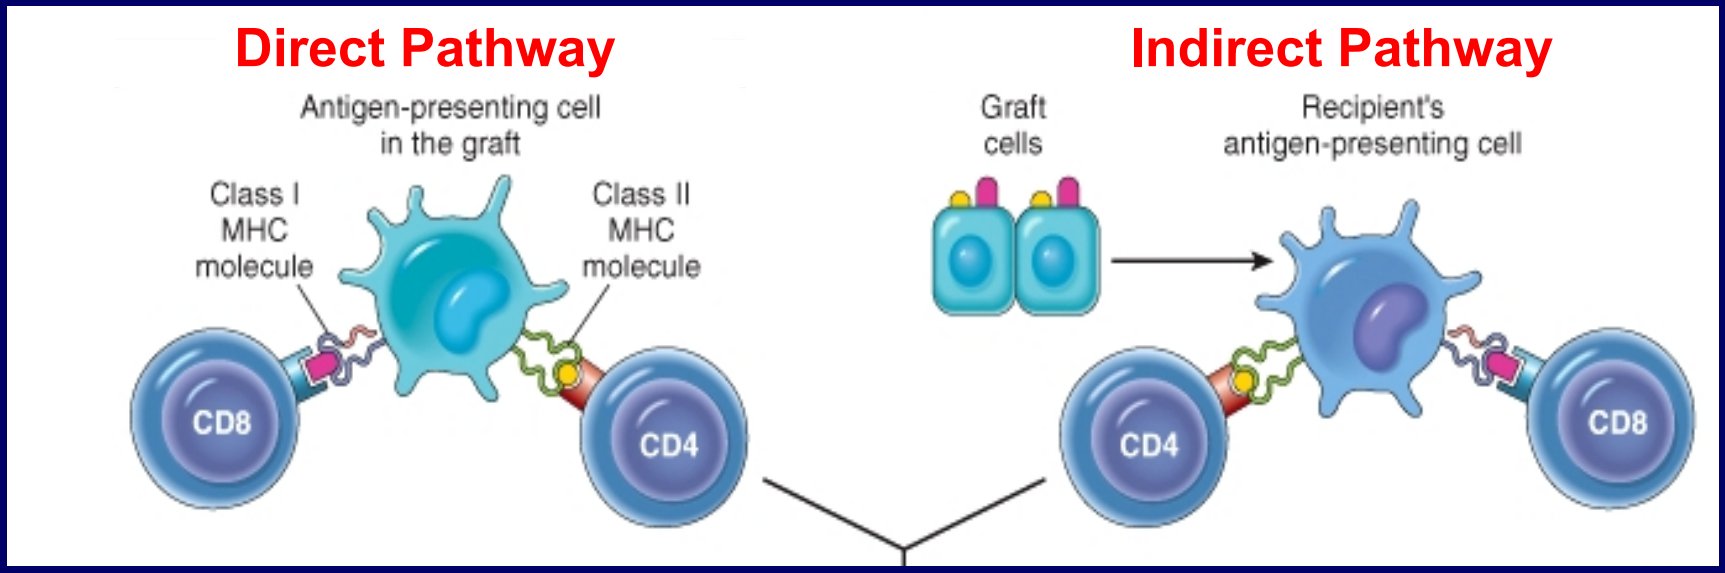
Injecting recipient mice with monoclonal antibodies to deplete one or both types of T cells

# Transplantation

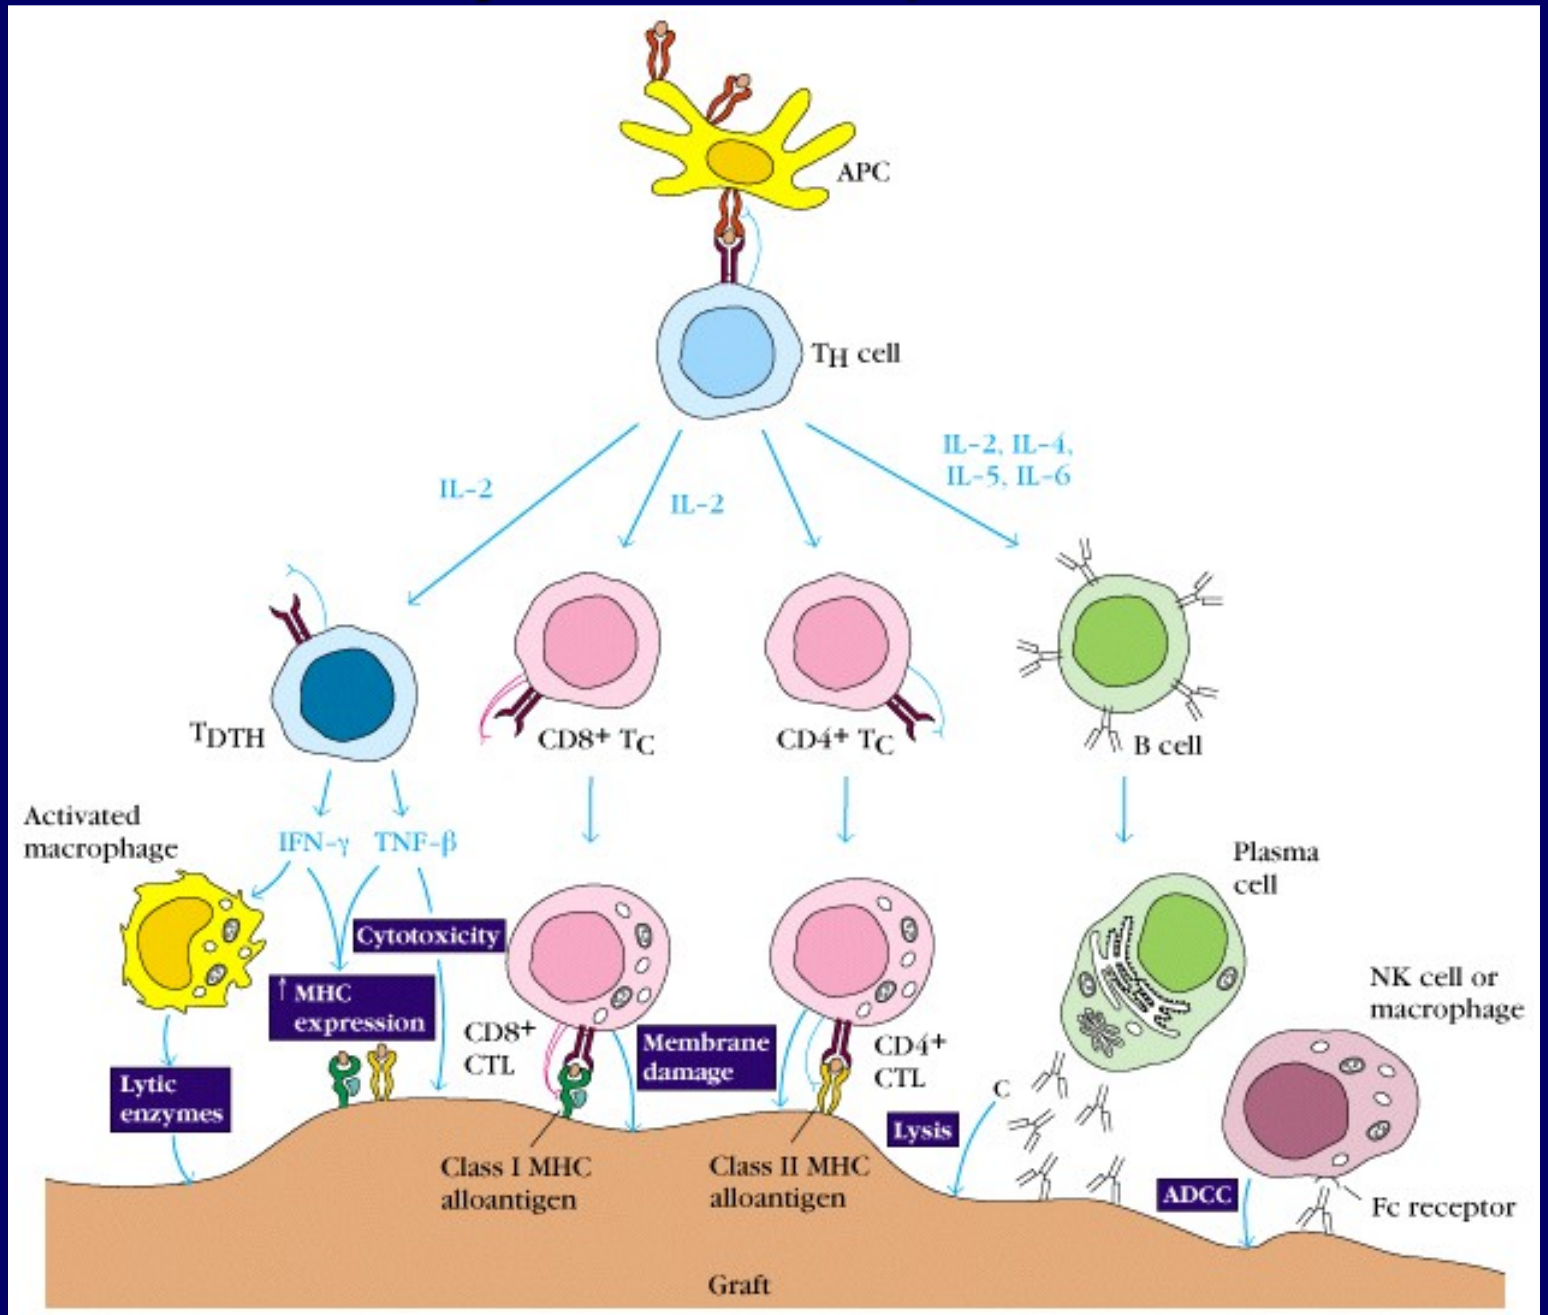
- T cells play primary role in 1st and 2nd set rejection reactions
  - Nude mice accept allografts (no T cells due to genetic modification resulting in absent thymus)
  - B cell deficient mice reject allografts

Nude mouse has a transplant of rabbit skin

# Mechanisms involved in Graft Rejection



# Rejection Response

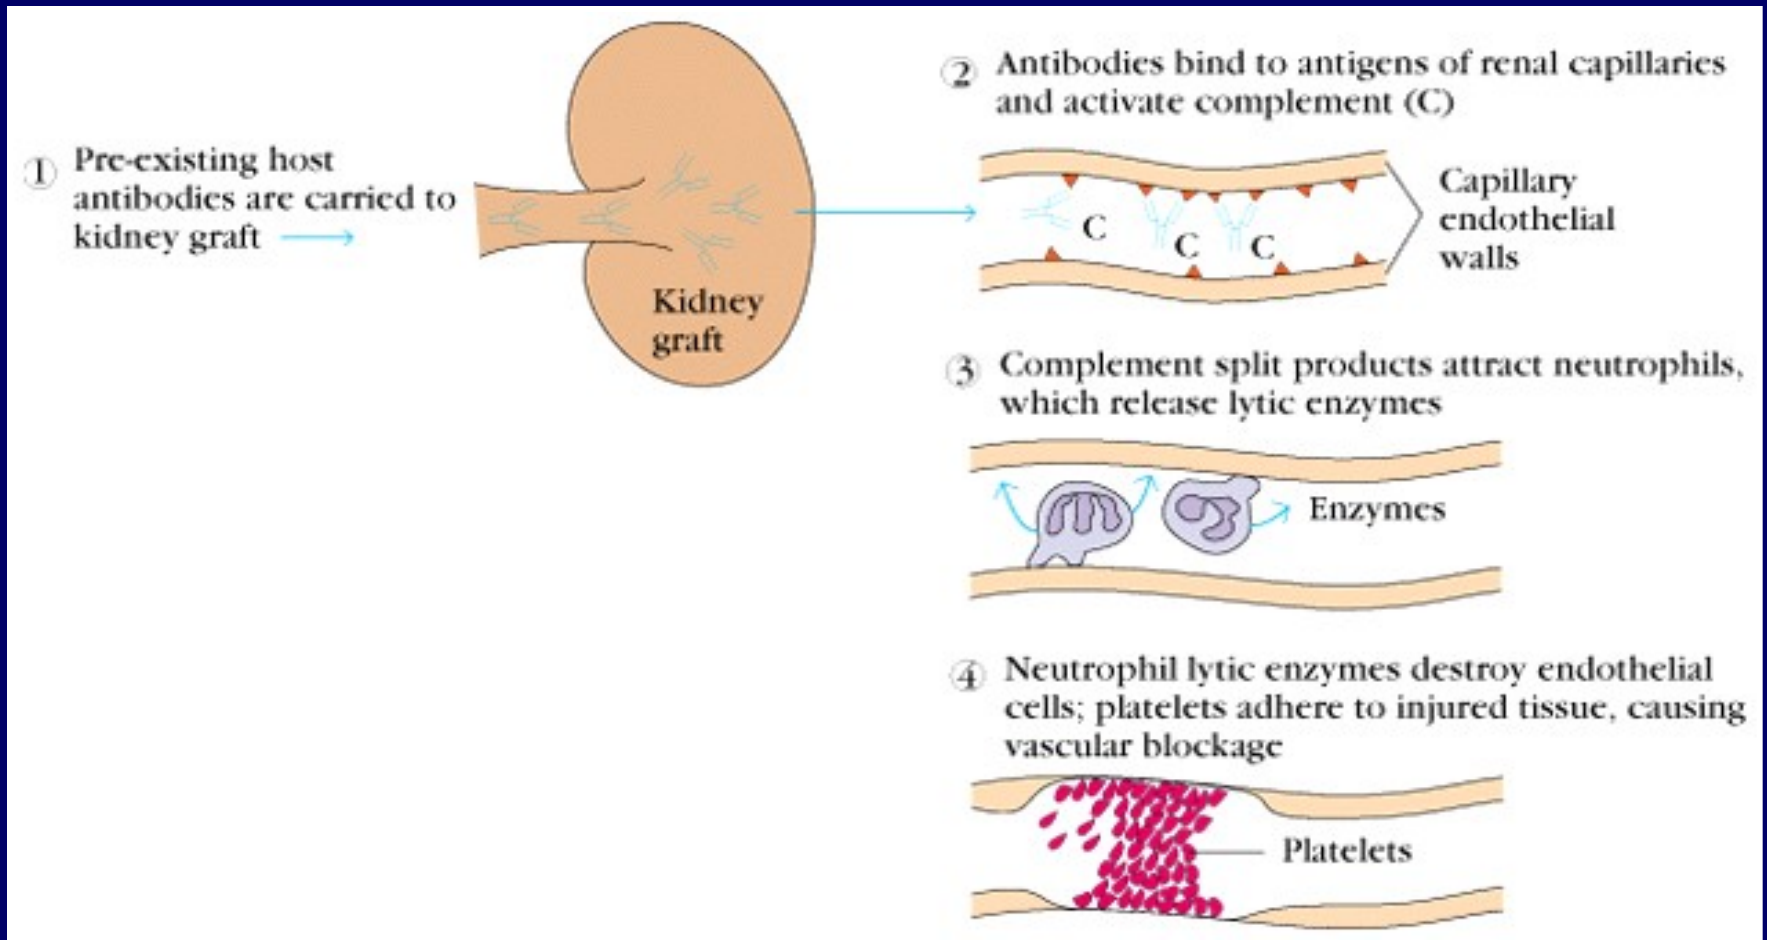


# Clinical manifestations of graft rejection

I. Hyperacute rejection: very quick

II. Acute rejection: about 10 days (cell mediated)

III. Chronic rejection: months-years (both)



# Chronic Rejection

- This occurs months to years after engraftment
- Main pathologic finding in chronic rejection is atherosclerosis of the vascular endothelium
- Main cause of chronic rejection is not known
  - Minor histo-compatibility antigen miss match

# Graft-versus-Host (GVH) Reaction

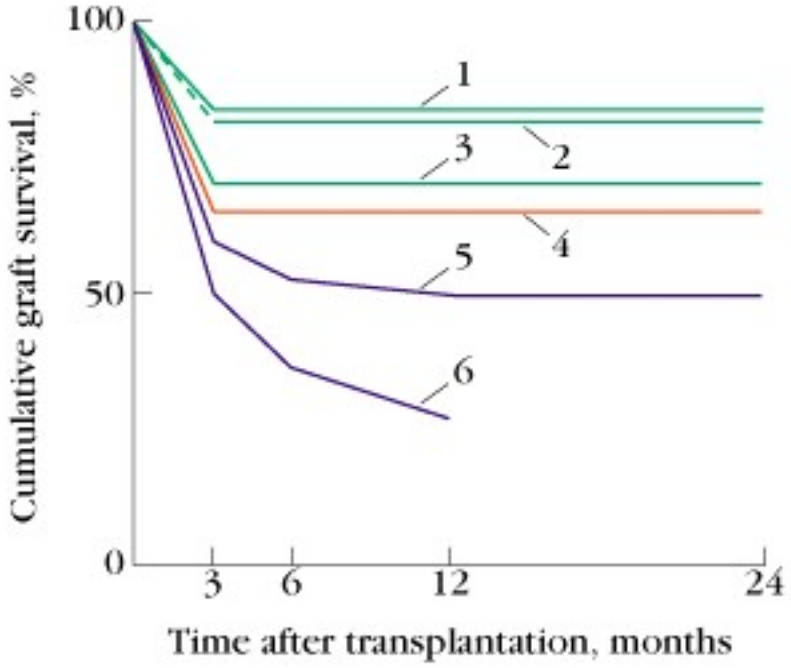
- Occurs in about two thirds of bone marrow transplants
- Occurs because grafted immunocompetent T cells proliferate in the irradiated immunocompromised host and reject cells with foreign proteins resulting in sever organ dysfunction
- Donor's Tc cells play a major role in destroying the recipient's cells
- Symptoms are: maculopapular rash, jaundice, hepatosplenomegaly and diarrhea
- GVH reactions usually end in infections and death

# HLA Typing in the Laboratory

- Prior to transplantation laboratory test commonly called as ***HLA typing* or *tissue typing*** to determine the closest MHC match between the donor and recipient is performed
- Methods
  - DNA sequencing by Polymerase Chain Reaction (PCR)
  - Serologic Assays
  - Mixed Lymphocyte Reaction (MLR)
  - Crossmatching – (Donor) lymphocytes +(Recipient) serum + complement.

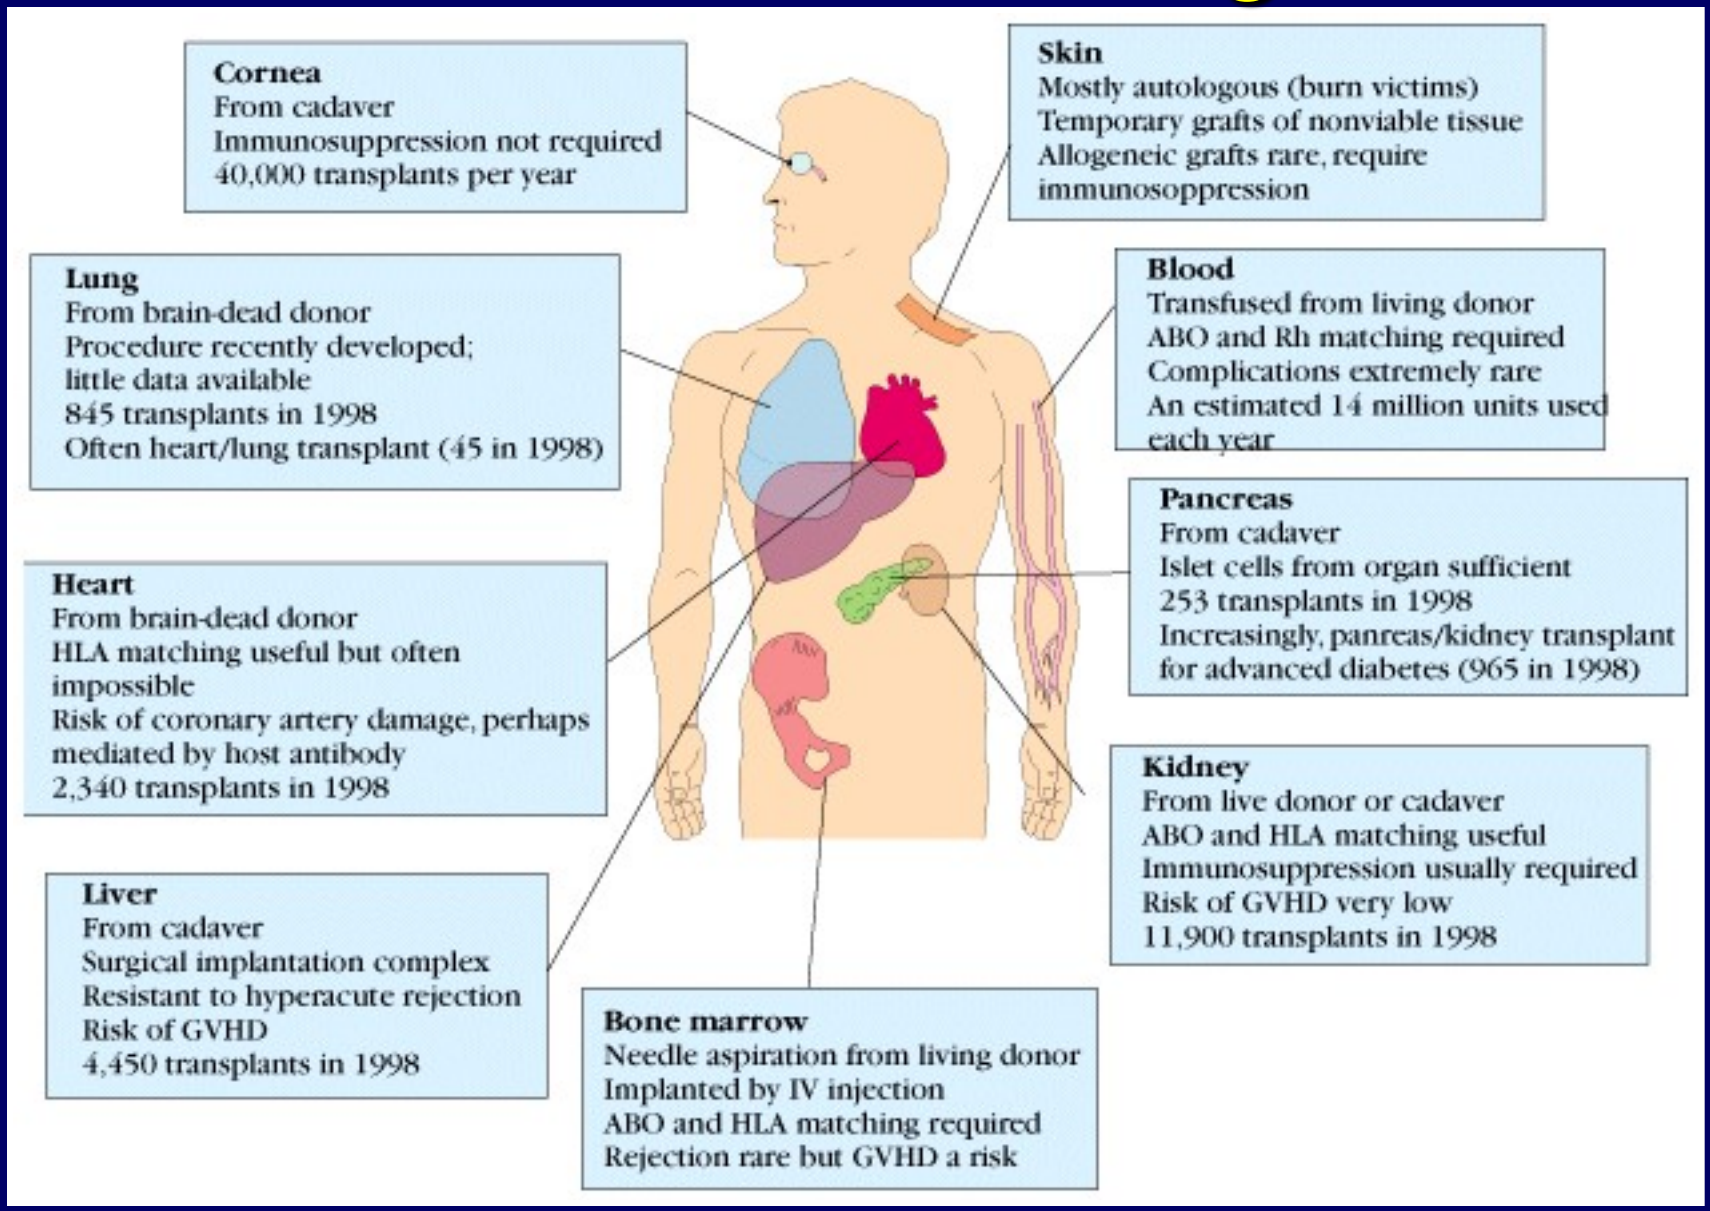
# Tissue Matching

## Effect of HLA class I & II matching on survival of kidney grafts



| Curve no. | HLA mismatches (no.) Class I | Class II |
|---|---|---|
| 1 | 0 | 0 |
| 2 | 1 or 2 | 0 |
| 3 | 3 or 4 | 0 |
| 4 | 0 | 1 or 2 |
| 5 | 1 or 2 | 1 or 2 |
| 6 | 3 or 4 | 1 or 2 |

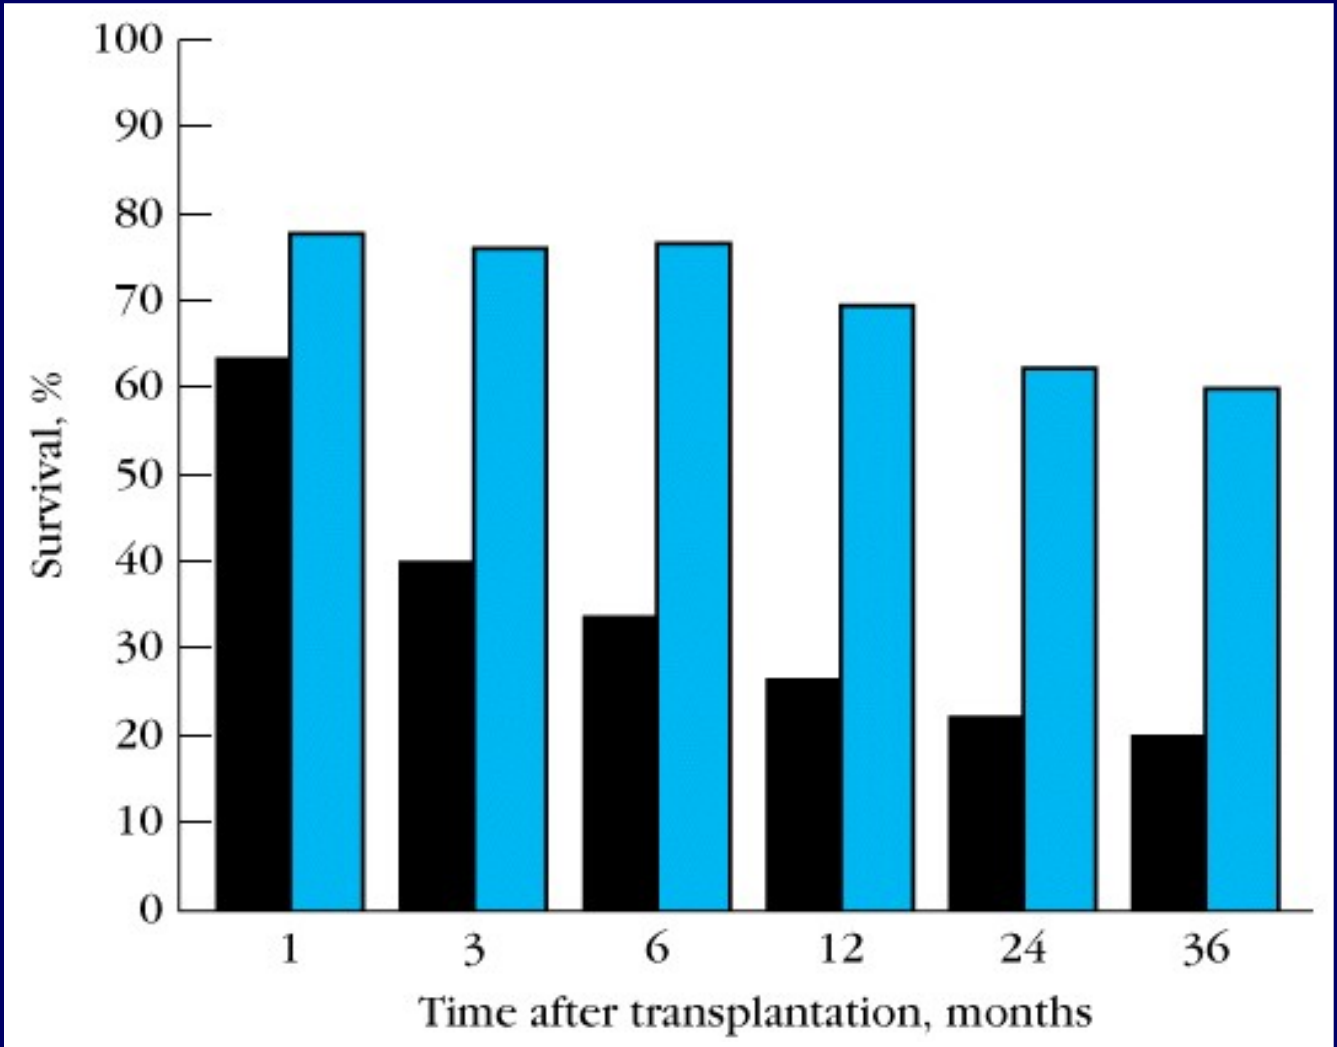
# Tissue Matching



# General Immunosuppression Therapy

1) Mitotic inhibitor: azathioprine (pre & post)
2) Corticosteroids
3) Cyclosporin
4) Total lymphoid irradiation

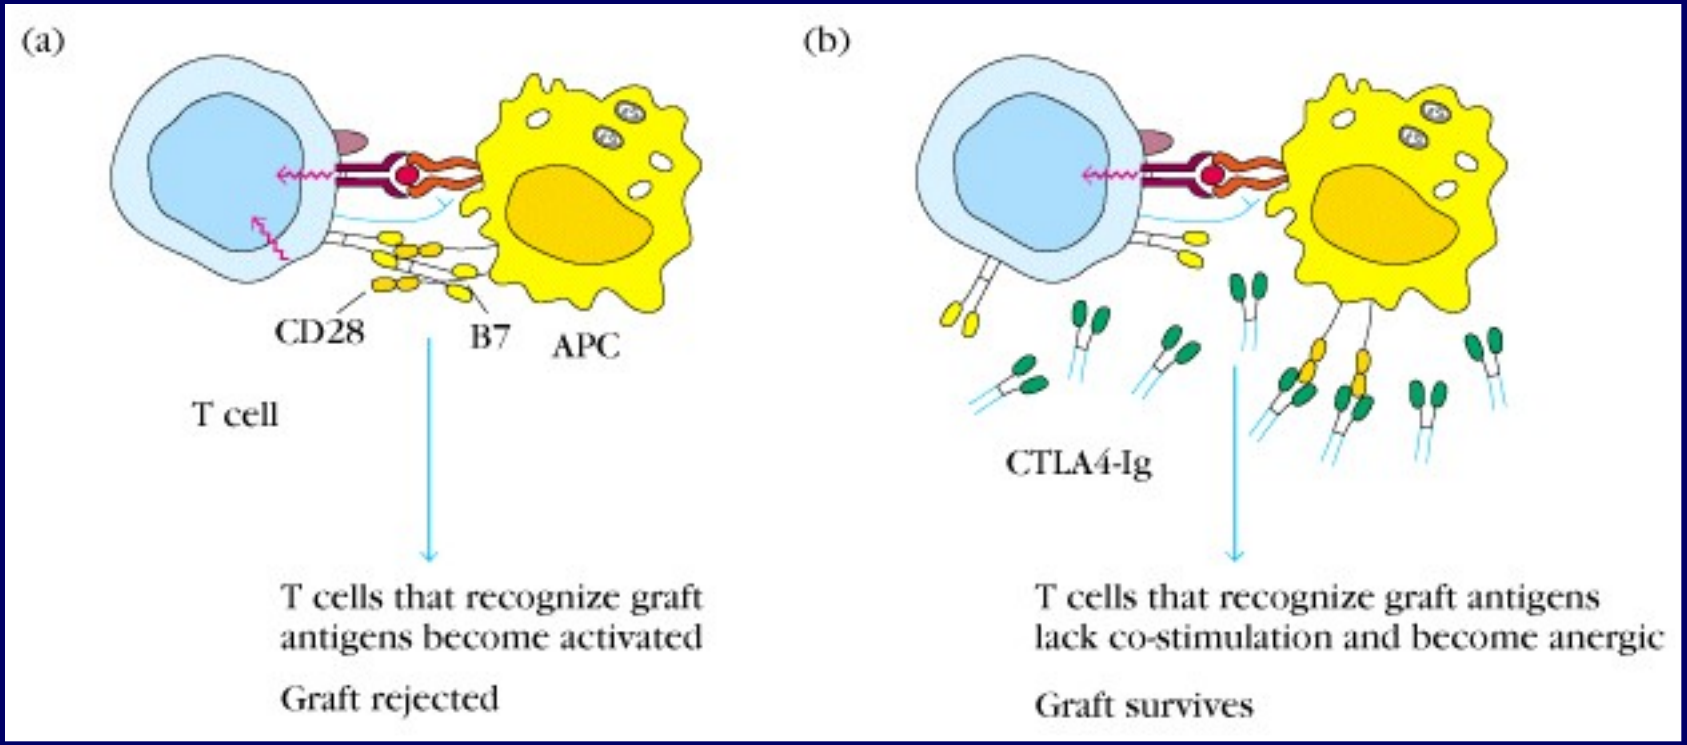
# Immunosuppresive Therapy



# Specific Immuno-suppression therapy

a) Monoclonal antibodies against T cell components or cytokines

b) Agents blocking co-stimulatory signal



# Immuno-suppresive Therapy

- Downsides
  - Must be maintained for life
  - Toxicity
  - Susceptibility to infections
  - Susceptibility to tumors

# Take home message

- HLA or MHC molecule miss-match can stimulate humoral and cell mediated immunity which is the main cause of rejection of transplants
- Cell mediated immune responses play a major role in transplant rejection
- Tissue matching particularly for HLA-D antigens is important for successful transplantation
- Immuno-suppresive therapy is usually required after transplantation

# Thank you
