

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

اللهم صل على محمد وآل محمد

السلام عليكم ورحمة الله وبركاته

Physiology of Pain

*Dr. Hayam Gad
Associate Professor of
Physiology*

Learning Objectives

- *Pain receptors (nociceptors)*
- *Effects associated with pain sensation*
- *Mechanism of stimulation of pain receptors*
- *Qualities of pain*
- *Types of pain*
 - *Somatic pain (superficial & deep pain).*
 - *Visceral pain.*
- *Referred pain*
- *Pathway of pain*
 - *The neospinothalamic pathway*
 - *The paleospinothalamic pathway*
- *Role of cerebral cortex in pain perception*

Pain

Pain is unpleasant sensation and emotional experience associated with actual or potential tissue damage.

Pain is characterized by the following:

- *It has a **protective function**.*
- *All pain receptors are **free nerve endings** of unmyelinated **C fibers** & small diameter myelinated **A δ fibers**.*
- *Pain receptors are the most **widely distributed**.*

Merkel cell

TOUCH

Free endings

TOUCH

COLD PAIN

**Pacinian
corpuscle**

Pressure

**Meissner's
corpuscle**
TOUCH

- 
- *Pain sensation can be produced by **various types of stimuli** i.e. mechanical, thermal & chemical, hence the existence of mechanoreceptors, thermoreceptors, & polymodal pain receptors (nociceptors).*
 - *Pain receptors **adapt very little**, if not at all.*

- 
- *Localization of pain stimuli is less exact than that of other modalities.*
 - *Pain receptors are **high threshold receptors** i.e. painful stimuli must be strong & noxious to produce tissue damage.*
 - *Pain is **perceived at both the cortical & thalamic** levels.*

Effects associated with pain sensation

1- Motor reactions

These may take the form of:-

- * Reflexes e.g. withdrawal reflex.*
- * Muscle rigidity (stiffness).*

2- Autonomic reactions

- * Mild pain stimulates post. hypothalamic N→ sympathetic changes e.g. tachycardia.*
- * Sever pain stimulates ant. hypothalamic N→ parasympathetic changes e.g. bradycardia.*

3- Emotional reactions as anxiety, crying.....etc.

Mechanism of stimulation of pain receptors (nociceptors)

- *Pain receptors are depolarized either directly or through the production of **pain producing substances** that are produced from damaged tissues as a result of inflammation (also called inflammatory mediators) e.g. bradykinin, serotonin, histamine, interleukins, substance P, K^+ , Ach, proteolytic enzymes.*
- *Prostaglandins & interleukins lower threshold of pain receptors.*

Qualities of pain

I. Fast pain (immediate, first)

- *It is also called pricking, acute, sharp or electric pain.*
- *It occurs mainly in **skin** by mechanical or thermal stimuli.*
- *It is transmitted via type **A δ fibers**, conduction velocity 3-30m/s, account for **20%** of nociceptors primary afferents, arise from all types of nociceptors.*

- 
- It appears **very rapidly** within 0.1 sec., and lasts for short time.
 - It is usually **well localized**.
 - The neurotransmitter is glutamate.
 - e.g. The type of sensation felt when skin is cut with a knife.

II. Slow pain (delayed or second)

- *It is also called **burning**, aching or chronic pain.*
- *It occurs in **skin, deep tissues & viscera**.*
- *It is transmitted via **type C** fibers, conduction velocity $< 2\text{m/s}$, account for **80%** of nociceptors primary afferents, arise from polymodal nociceptors.*

- 
- It appears **slowly**, after one sec. or more, and lasts for longer duration.
 - The neurotransmitter is **substance P**.
 - It is diffused (**poorly localized**).

Types of pain

Pain can be classified according to the site of stimulation into:-

- 1. Somatic pain (superficial & deep pain).*
- 2. Visceral pain.*

Superficial pain

- *It arises from skin or other superficial structures.*
- *It occurs in 2 phase of **fast pricking** followed by **slow burning** pain.*
- *It can be **well localized**.*
- *It may be associated with motor, autonomic, emotional reactions.*

Deep pain

- *It originates from muscles, joints, periosteum, tendons & ligaments*
- *It is **slow prolonged** conducted by type **C fibers**.*
- *It is **diffuse** (i.e. poorly localized).*

- 
- It can initiate *reflex contraction* of nearby muscles.
 - It may be *referred* to other sites.
 - It is caused by: trauma, bone fracture & inflammation, arthritis, muscle spasm & ischemia.

Visceral pain

- *There are few pain receptors in most viscera*
- *Some viscera are pain insensitive e.g. **liver**
parenchyma, **lung alveoli**, **brain tissue**,
visceral layer of peritoneum, **pleura** and
pericardium.*

Characters of visceral pain

- It is **slow** pain conducted by **C fibers** (pain arising from parietal peritoneum, pleura and pericardium is sharp, pricking type).
- It is **diffuse**, the patient feels pain arising from inside but he cannot pinpoint it exactly.
- It is often associated with **autonomic reactions**.
- It can be associated with **rigidity** of nearby muscles.
- It may be **referred** to other sites.

Causes of visceral pain

- ☞ *Distension of a hollow organs*
- ☞ *Inflammation of an organ.*
- ☞ *Ischemia e.g. pain due to myocardial ischemia.*

Referred pain

- *This is pain that is felt away from its original site.*
- *It is most frequent with visceral pain & deep somatic pain but **cutaneous pain is not referred.***
- *Pain is referred according to dermatomal rule.*

Examples of referred pain:

- *Cardiac pain* is referred to left shoulder & inner side of left arm.
- Pain of *appendicitis* is referred to umbilical region.
- Pain from the *ureter* is referred to testicular region.

| <i>Organ</i> | <i>Site of referred pain</i> |
|---------------------------|--------------------------------|
| <i>Meninges</i> | <i>Back of head & neck</i> |
| <i>Heart</i> | <i>Central chest, left arm</i> |
| <i>Diaphragm</i> | <i>Shoulder tip</i> |
| <i>Esophagus</i> | <i>Behind sternum</i> |
| <i>Stomach, duodenum</i> | <i>Epigastrium</i> |
| <i>Kidney</i> | <i>Loin</i> |
| <i>Ureter</i> | <i>Testicles</i> |
| <i>Trigone of bladder</i> | <i>Tip of penis</i> |
| <i>Hip</i> | <i>Knee</i> |
| <i>Appendix</i> | <i>Umbilicus</i> |
| <i>Uterus</i> | <i>Low back</i> |

Mechanism of referred pain

Convergence theory

- *Afferent nerves from somatic structure & viscera that develop from same embryonic segment converge on same spinothalamic tract.*
- *Since brain is accustomed to receiving impulses from skin than viscera, so pain impulses carried to cortex along spinothalamic neurons shared by afferents from skin & other from diseased viscus are **misinterpreted** by the brain as coming from skin.*

Facilitation theory

Pain fibers from skin are always carrying impulses, but they are not enough to produce pain. Impulses from diseased viscus pass through afferents which give collaterals to ST neurons receiving pain fibers from skin. As a result, ST neurons' excitability is raised (they are facilitated) to reach a threshold level. The signals reaching the brain are projected to skin area and pain is felt in skin dermatome

Pathway of Pain

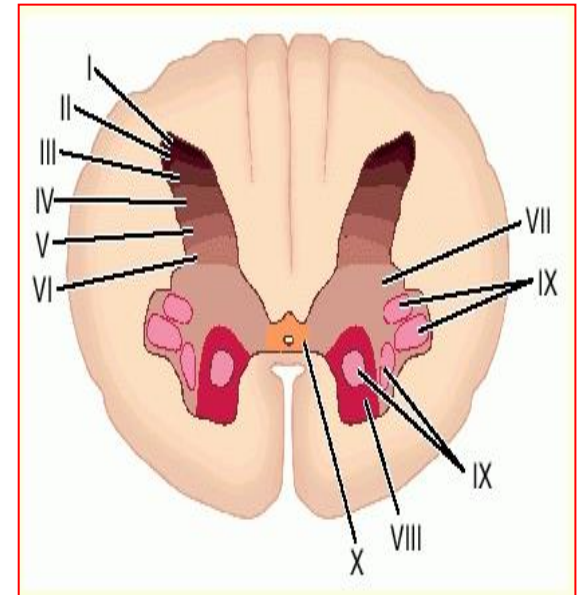

Pain sensation is carried by **lateral spinothalamic tracts** which includes 2 separate pathways:-

A) The neospinothalamic pathway:

This transmits fast pain & thermoceptive sensation.

○ **First order neurons**

Are mainly **A δ** afferent nerves. They ascend few segments in Lissauer's tract & terminate at lamina I & V of D. horn.

○ Second order neurons

These constitute the tract. They start at dorsal horn, cross to opposite side and ascend in lateral column of spinal cord. The fibers ascend in brain stem to terminate in ventrobasal complex of thalamus.

○ Third order neurons

These start at thalamus & project to somatosensory cortex.

Somatosensory cortex

Thalamus

Collaterals to reticular formation

Brainstem

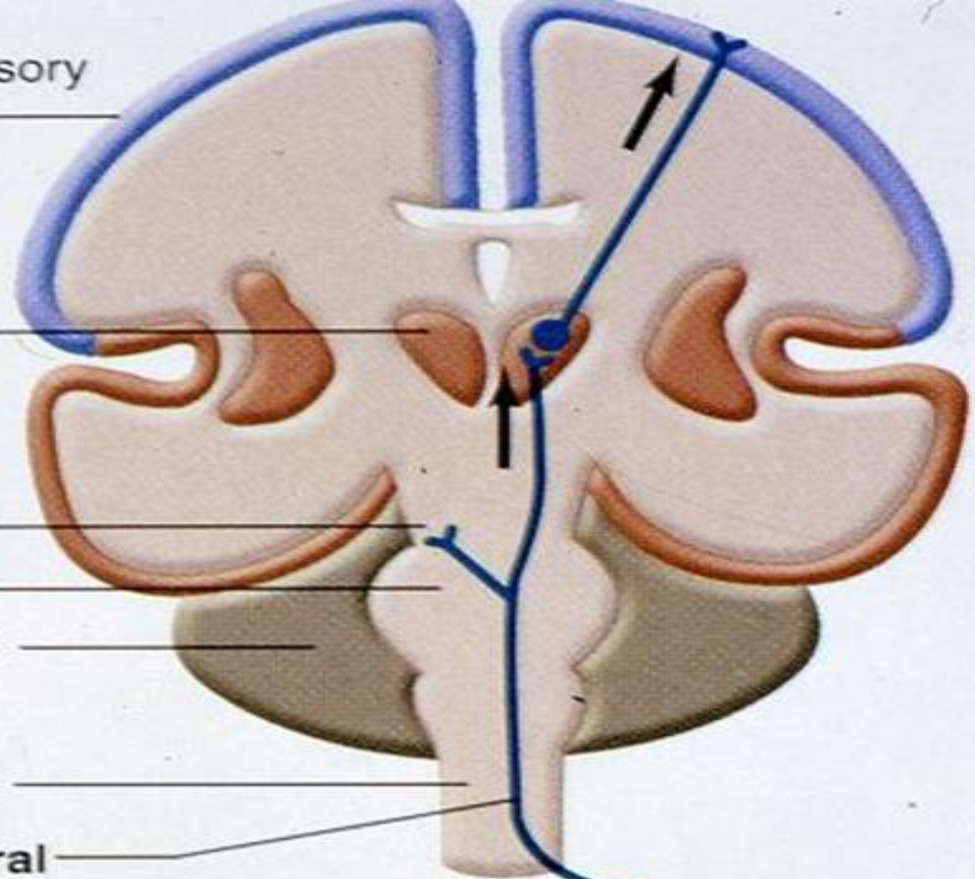

Cerebellum

Spinal cord

Anterolateral system

Afferent nerve fiber from pain or temperature

Spinal cord

B) The paleospinothalamic pathway:

This transmit slow pain sensation & thermoceptive sensation.

○ First order neurons

*They are mainly **type C fibers**. They enter spinal cord via dorsal roots, ascend a few segments in Lissauer' tract & terminate at substantia gelatinosa in laminae II & III of dorsal horn.*

○ Second order neurons

They start at SGR, cross to opposite side in front of central canal, ascend in lateral column of SC & terminate at:-

- *Reticular formation of brain stem.*
- *Intralaminar nuclei of thalamus.*
- *Hypothalamus & adjacent region of basal brain.*

Impulses arriving these regions have strong arousal effects and can be perceived.

○ *Third order neurons*

- *These start at thalamus,*
- *Project to all parts of cerebral cortex.*

Role of cerebral cortex in pain perception

- *Full perception of pain occurs when signals enter RF of brain stem, thalamus & basal regions.*
- *Somatosensory cortex plays important role in topognosis i.e. **localization & interpretation of pain quality.***
- *Fast pain is localized better than slow pain because signals carried in neospinothalamic tract reach somatosensory cortex, while a small proportion of paleospinothalamic pathway reach there.*

Thank You

The text "Thank You" is rendered in a highly decorative, cursive script. The letters are filled with a deep red color and outlined with a thick, metallic gold border. The text is embellished with clusters of vibrant red roses and green foliage. Two white doves are depicted in flight, one positioned above the letter 'h' and the other above the letter 'o'. The entire graphic is set against a plain white background.
