

**DRUGS USED IN**

# **MALE INFERTILITY**

# DRUGS USED IN MALE INFERTILITY

## ILOs

By the end of this lecture you will be able to:

- ✿ Define male infertility
- ✿ Recognize regulations contributing to male fertility & dysregulations leading to infertility
- ✿ Classify hormonal & non-hormonal therapies used in male infertility whether being empirical or specific.
- ✿ Expand on the mechanism of action, indications, preparations, side effects, contraindications & interactions of most hormonal therapies
- ✿ Highlight some potentialities of empirical non-hormonal therapies

## MALE INFERTILITY

### Definition

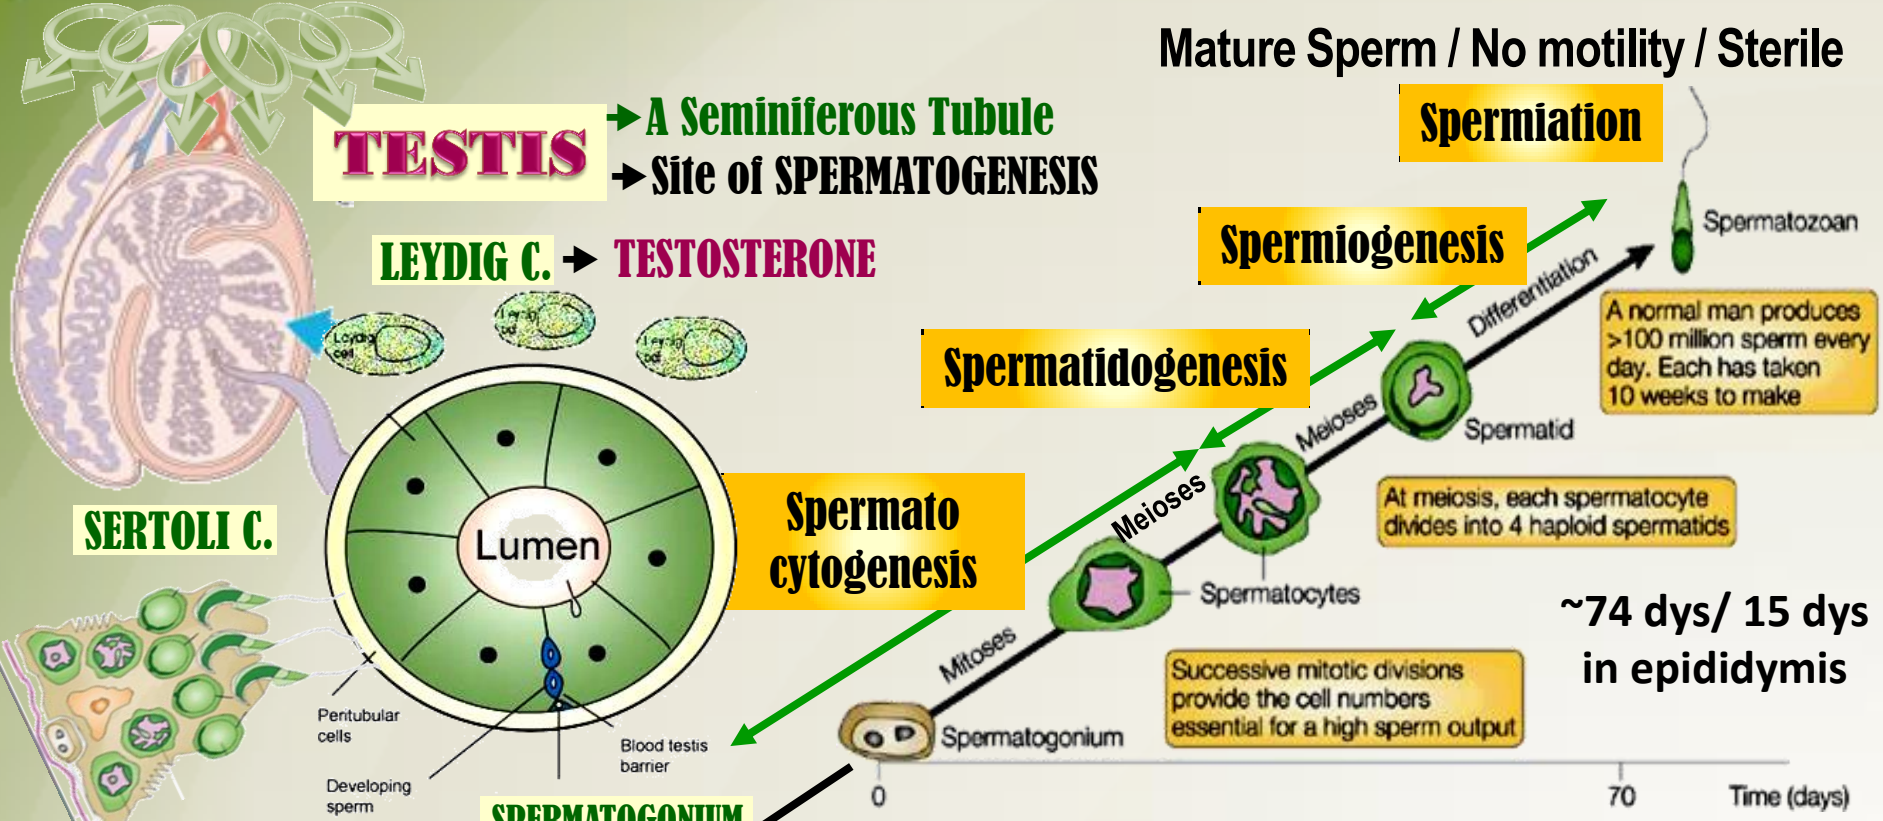

Inability of a male to achieve conception in a fertile woman after one year of unprotected intercourse.

### Prevalence

Approximately 15-20% of all cohabiting couples are infertile  
In up to  $\pm$  50% of such cases, males are responsible

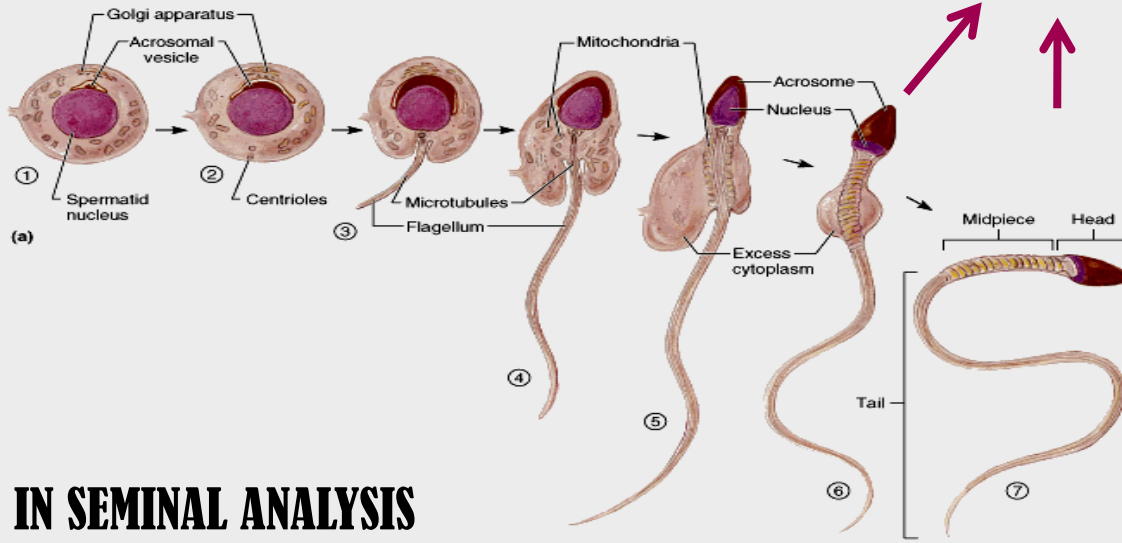

**Nests** → the **GERM CELLS**

- Communicate in a paracrine fashion
- Separate them from rest of body by the blood-testicular barrier
- Converts **Testosterone** to **Dihydrotestosterone [DHT]** & **Estradiol** to direct spermatogenesis
- Secret androgen-binding-proteins [**ABP**] → concentrate & ↑ testosterone in seminiferous tubules to stimulate spermiogenesis

**Testosterone Secretion & Spermatogenesis Are Coupled**

# Steps from Spermatid to Spermatozoan

Proceed → Seminiferous ducts → Rete testis  
 → Efferent ductules → Epididymis

**DHT > Testosterone + Estradiol  
 + other paracrine/autocrine**

**[ Develop Motility & Fertilizing ability  
 Protection+Storage ] Till Ejaculation**

**Prostatic & seminal secretions add to  
 sperm functions**

## IN SEMINAL ANALYSIS

### Alteration in sperm quantity

Low ( oligospermia) or non (azoospermia)

### Alteration in sperm quality

Low motility (asthenospermia) or dead (necrospermia)

### Alteration in both

**If something went WRONG → INFERTILITY**

**If WRONG → INFERTILITY**

**3. Problems of Sperm Transport**

**POST-TESTICULAR**

Initiation & Maintenance of spermatogenesis

**4. Problem in Erection & Ejaculation**

**2. Problems related to Sperm Production**

**PRE-TESTICULAR**

**1. Problems related to Hormone Production**

**TESTICULAR**

**LH → Testosterone → Pulsatile  
(chronic LH → makes testis refractory)**

**MALE INFERTILITY**

# DRUG TREATMENT OF MALE INFERTILITY

Needs 3 ms. before semen quality changes

## HORMONAL THERAPY

## NON-HORMONAL THERAPY

### SPECIFIC

### IMPERICAL

### IMPERICAL

### SPECIFIC

Hyperprolactinaemia → *DA<sub>2</sub> Agonists*  
 Hypothyroidism → *Thyroxine*  
 Congenital Adrenal Hyperplasia → *Glucocorticoids*

Erectile Dysfunction → *PDE 5 Is, Alprostadil, Apomorphine...*  
 Premature Ejaculation → *SSRIs*  
 Retrograde Ejaculation → *αAD agonists*  
 Leukocytospermia → *Antibiotics*

- **Euogonadotrophic Hypogonadism** → (↓T only) *Antiestrogens; SERMs & Aromatase Is*
- **Idiopathic** → *Androgens, Antiestrogens, GnH(FSH)*
- **Hypogonadotrophic hypogonadism** → 2<sup>nd</sup>ry Hypogonadism (Hypothalamo-Pituitary) (↓T & ↓FSH/LH) *Pulsatile GnRH, hCG, hMG, Androgens, Clomiphene*

- *Pentoxiphylline*
- *Kallikrins*
- *Antioxidants; Vit E, C/ N-A Cystiene*
- *Zinc Supplements*
- *Folic a.*
- *L-Carnitine*

■ **Hypergonadotrophic Hypogonadism** → Priy Hypogonadism (↓T & ↑LH) *Assisted Reproduction*

# HORMONAL THERAPY

## 1. ANDROGENS

### In NATURE

Principle male sex hormone produced in testis, small amount in adrenals.  
It follows a circadian pattern →  $\uparrow$  in early morning &  $\downarrow$  in evening

### As Therapy

#### 1. Testosterone

#### 2. Synthetic Androgens;

Derived from Testosterone

Esters; proprionate, enanthate, cypionate

Or derivatives as Fluoxymesterone, Methyltestosterone, Danazol

Derived from DHT; Mesterolone

## What does testosterone do ?

### A. It or its DHT metabolite bind to **Androgen Receptors [AR]**

Like all other steroid hormones they act on;

**1. Cytosolic → GENOMIC Action** → mediates cell growth & differentiation in AR responsive tissues; reproductive, those of 2<sup>nd</sup>ry male sex characters, muscles ...

- Binding & Activation
- Nuclear translocation
- Dimerization on SRE
- Gene Transcription
- mRNA Translation
- New Protein Formation

# 1. ANDROGENS

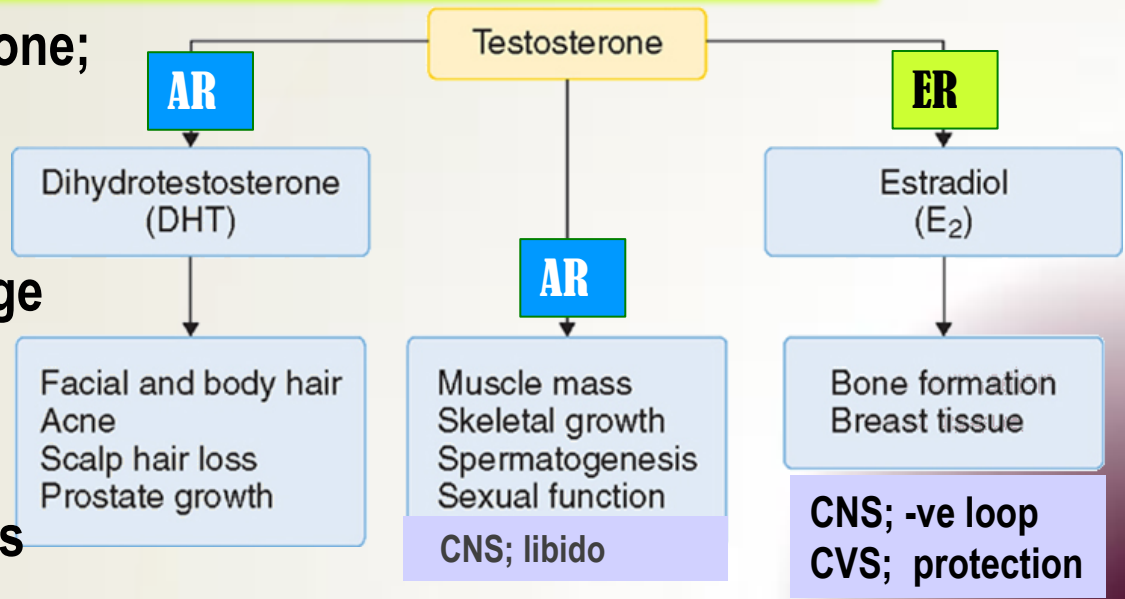

**2. Membranous → NON-GENOMIC Action** → mediates rapid responses → on some brain, CVS, T cells functions

Like all other steroid receptors

## B. It aromatize to estradiol and binds to Estrogen Receptors [ER]

Estradiol rather than testosterone;  
 1. Responsible for feedback inhibition on hypothalamus (specially -ve LH secretion)  
 2. Induce maturation of cartilage → leading to closure of epiphyses & conclusion of growth.  
 3. Some CVS protective actions

# 1. ANDROGENS

## ACTIONS

### ACTIONS DIVIDED INTO

#### Virilizing effects

- Gonadotropin regulation
- Spermatogenesis
- Sexual dysfunction
- Sexual restoration and development

#### Protein anabolic effects

- Increased bone density
- Increased muscle mass
- Increased red blood cell mass

← **Testosterone & Synthetic Androgens**

← **Anabolic Steroids**  
**Not used in infertility**

# 1. ANDROGENS

## Kinetics

- Binds to SHBG
- $t_{1/2} = 10 - 20$  min
- Inactivated in the liver.; 90% of metabolites → excreted in urine.
- Synthetic androgens → less rapidly metabolized & some are excreted unchanged in urine

## Administration

**Testosterone** → ineffective orally (inactivated by 1<sup>st</sup> pass met.) → **I.M or S.C.**

*Skin patch (genital & no genital) & gels.... are also available*

## Synthetic Androgens

### Derived from Testosterone

- Esters; proprionate, enanthate, cypionate → in oil for **IM**; every 2-3 weeks
- Other derivatives as Fluoxymesterone, Methyltestosterone, Danazol → given **Orally**; daily

Derived from DHT; Mesterolone → given **Orally**; daily

# INDICATIONS

## 1. ANDROGENS

### In adult Male Infertility

1. Low dose oral (methyltestosterone 10-50 mg/day) or (fluoxymesterone 5-20 mg/day) may improve epididymal function & ↑ sperm motility
2. High dose exogenous testosterone given then abruptly stopped will  
1<sup>st</sup> → ↑ systemic T levels → -ve feedback → ↓ LH & ↓ endogenous testosterone production → ↓ spermatogenesis.  
2<sup>nd</sup> → **TESTOSTERONE REBOUND** → ↑ spermatogenesis after stoppage .  
The success rate is very low . Hazards are high → many men become azoospermic for prolonged periods after. Now this is best avoided

### As Androgen Replacement Therapy

- In delayed puberty with hypogonadism  
→ give androgen slow & spaced for fear of premature fusion of epiphyses → short stature

# 1. ANDROGENS

## Specific In Males

1. Prostatic hyperplasia → carcinoma specially in elder (give low dose)
2. 2<sup>nd</sup>ry Gn H suppression ; azoospermia, impotence, gynecomastia (if taken > 6 wks).
3. Short stature due to premature closure of epiphysis (before 18 years)

## General

1. Behavioral changes; physiologic dependence, ↑ aggressiveness, psychotic symptoms
2. Alteration in serum lipid profile: ↓ HDL & ↑ LDL; ↑ risk of ACS
3. Salt & water retention
4. Hepatic dysfunction; ↑ AST levels, ↑ alkaline phosphatase, ↑ bilirubin & cholestatic jaundice.  
Most oral preparations are hepatotoxic → adenomas & carcinomas
5. Polycythemia

# Contraindications

- Male patients with cancer breast or prostate
- Severe renal & cardiac disease → predispose to edema
- Psychiatric disorders
- Hypercoagulable states
- Polycythemia

## 1. ANDROGENS

## Interactions

- All forms + corticosteroids → oedema
- All forms + warfarin → ↓ metabolism → ↑ bleeding
- Synthetic Androgens + insulin or oral hypoglycemics → hypoglycemia
  - Testosterone + propranolol → ↑ propranolol clearance → ↓ efficacy

## Mesterolone

→ oral synthetic androgen derived from DHT is more safely given if ↓ testosterone or in 2ndry hypogonadism. Why???

1. Not aromatised into estrogens/ no binding to estrogen receptors → no -ve of GnHs → encourages natural testosterone production + ↓ SHBG from attaching to it → spermatogenesis is enhanced
2. Unlike almost all other orals synthetic androgens it is not hepatotoxic; not -alkylated but methylated → less hepatic complications

## 2. GnRH

**LEUPROLIN GOSERELIN**

Used in hypothalamic dysfunction → androgenization & spermatogenesis  
Given as Pulsatile GnRH therapy (4-8 ug subcut every 2 hours) using a portable pump. Less use by intranasal or intravenous routes  
Exogenous excess of GnRH → down-regulation of pituitary GnRH receptors & ↓ LH responsiveness.

ADRs: Headache, depression, generalized weakness, pain & gynecomastia  
osteoporosis, neurological symptoms.

Prostate cancer (on long term), yet can be prevented with the simultaneous use of antiandrogens for 2-4 weeks

## 3. GnHs

**PREGNYL hCG MENOTROPIN hMG**

Used in 2ndry hypogonadism (FSH or both FSH or LH absent) → ↑ spermatogenesis

GnHs replacement must be combined; hCG (3 x 2000 U/w. IM. → 2 ms.) followed by hCG + hMG (3x 75 to 3 x 150 U /w. IM. → 6 -12 ms). rhFSH alone → little efficacy

ADRs: Headache, local swelling (injection site), nausea, flushing, depression, gynecomastia, precocious puberty, anaphylactic shock.

## 4. Antiestrogens

Because estrogens → -ve feedback on hypothalamus → ↓ GnRH pulse frequency & pituitary responsiveness to GnRH, so antiestrogens → used, with the rationale that absence of such feedback inhibition → ↑ GnRH & improve its pituitary response.....

### 4.a. SERMs Tamoxifen, Clomiphene

**Tamoxifen** → ↑ GnRH, but has its own estrogen agonistic property → feminizing side effects.

**Clomiphene** → has less estrogenic agonistic property. Yet both drugs can induce libido & bad temper in men

### 4.b. Aromatase Inhibitors Anastrozole

Blocks conversion of testosterone to estrogen within the hypothalamus

All are used for inducing spermatogenesis in oligozoospermia

Given as daily dose over a period of 1–6 months.

Best to improve sperm count & motility with good pregnancy rates

## **Non-HORMONAL THERAPY**

Sometimes it is very promising, to improve sperm quality > quantity.

### **ANTIOXIDANTS**

Protect sperm from oxidative damage

### **KALLIKREIN**

Has proteolytic activity, cleaving kininogen to kinins → important for sperm motility.

### **FOLIC ACID**

Plays a role in RNA and DNA synthesis during spermatogenesis & has antioxidant properties.

### **ZINC**

Plays an important role in testicular development, spermatogenesis & sperm motility.

### **L-CARNITINE**

Is highly concentrated in the epididymis & is important for sperm metabolism & maturation

# DRUGS USED IN MALE INFERTILITY

GOOD LUCK

| Cell type              | Chromosome | Chromatide | Process   |
