Definition of speech :

- It is the ability to express ideas in speech & writing
- Involves understanding of spoken & printed words
- It is the **highest function** of the nervous system

Brain Areas Involved in Language

Area	Location	Function
1 Wernicke's Area (Brodmann's area 22)	<ul style="list-style-type: none"> •At the posterior end of the superior gyrus of the temporal lobe •Closely associated with 1 & 2 auditory areas 	<ul style="list-style-type: none"> •Comprehension¹ of auditory & visual information, then project it to Broca's area via Arcuate fasciculus. •Interpretations² of sensory experience. •Formation of thought in response to sensory experience. •Choice of words to express thoughts.
2 Broca's Area (Brodmann's area 44 & 45)	At the lower end of premotor area in frontal lobe	<ul style="list-style-type: none"> •Process information received from Wernicke's area . area into detailed & co-ordinated pattern for vocalization³. •Then project it to motor cortex to initiate the appropriate movement of muscle of speech in tongue, larynx & lips.
3 Arcuate fasciculus	Bundle of axons connecting Wernicke's area with Broca's area	Conduction between the two areas.
4 Angular Gyrus (Brodmann's area 39)	Leis behind Wernicke's area fused posteriorly into the visual cortex of occipital lobe	Interpretation of information obtained from reading from visual cortex .

1: فهم. 2: The action of explaining the meaning of something. 3: نطق / لفظ.

Hand Skills Area

• If writing is concerned, then information received from Wernicke's area is processed in the **area of hand skills**

→ Coordinated pattern of muscle movement projected to the **arms & hand region of the motor cortex**

→ Initiation of necessary **muscle movement** in the hand & arms required for **writing** a particular word

• In **adult** who learn second language during adulthood. The MRI shows portion of Broca's area concerned with it is adjacent to but **separate** from area concerned with the native language

• But in **children** who learn second language early in life there is only **single area** involved for both languages

Aphasia

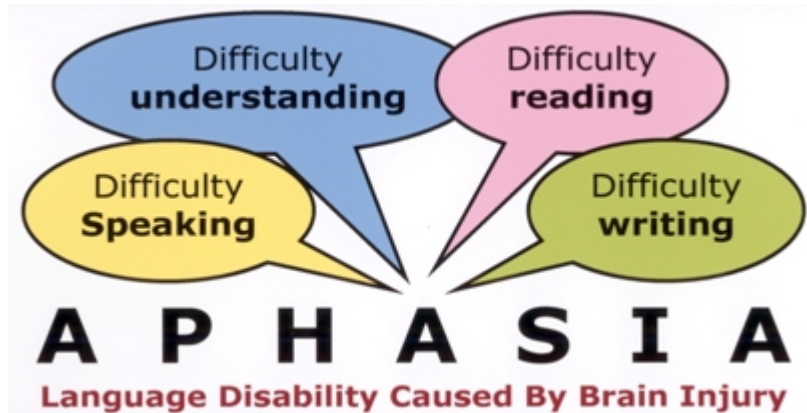

Abnormality of language function due to **injury of language center** in cerebral cortex, Comprehension or expression of words will be affected.

Result from damage to the speech centers within the left hemisphere.

✧ Causes:

Due to Thrombus or embolism of cerebral vessels, trauma, brain tumors, or from infections.

✧ **Dysarthria** : difficulty in **articulating** words by impairment of the muscles used in speech (**slurred speech**) and language centres are normal.

Types of Aphasia

Type	Motor or Broca's (Non-Fluent)	Sensory or Wernikes (Fluent)	Conductive (Fluent)	Anomic Aphasia	Global (Central) Aphasia
Location of lesion	Broca's area	Wernikes area +/- arcuate fasucul	Neve fibers of arcuate fasciculus	Angular gyrus B & W area intact	Broca's and Wernicke's aphasia
Response	<ul style="list-style-type: none"> •Understand spoken & written words but difficult to speech or to write. •Poorly articulated speech, slow with great effort & abnormal rhythm. 	<ul style="list-style-type: none"> •Impaired comprehension •Loss of intellectual function. •Failure to interprets meaning of written or spoken words. 	<p>Patient understand speech of others but can not repeat it → because it won't reach Broca's area as it is due to the damaged arcuate fasciculus</p>	<p>Speech and auditory comprehension normal but the visual is abnormal The visual info is not processed & not transmitted to W. area</p>	<p>Combination of the expressive problems of Broca's aphasia and the loss of comprehension of Wernicke's</p>
Speech	<p>Speech may be limited to 2-3 words Broca's aphasia = broken speech</p>	<p>Meaningless & excessive talk (in severe cases)</p>	<p>Meaningless speech</p>	<p>Dyslexia (word blindness) interruption in the flow of visual input into W. area</p>	<p>Can't either speak & understand language</p>

TO SEE HOW DO PATIENTS IN EACH TYPE REALLY LOOK LIKE, CHECK OUT THESE VIDEOS

The Concept of Dominant Hemisphere

Left hemisphere is usually dominant with respect to language, even in left handed people.

Right Hemisphere (the representational hemisphere)	Left Hemisphere (the categorical hemisphere)
Controls the left side of the body	Controls the right side of the body
5% of people either both sides develop simultaneously or rarely the right becomes highly developed.	95% of people
<ul style="list-style-type: none">- Temporal and spatial relationships.- Analyzing nonverbal information.- Communicating emotion.- Recognition of emotion.- Recognition of tunes, rhythms.- Holistic problem solving.	<ul style="list-style-type: none">- Produce, understand and manipulate language : recognition, use, and understanding of words and symbols- Speech- Identification of objects by name- Mathematics, logic, analysis

1- Which area responsible for interpretation of sensory experience ?

- A. Broca's area
- B. Visual cortex
- C. Wernicke's area
- D. Angular gyrus

2- The sensory information received from W. area and project to B. area via ?

- A. Angular gyrus
- B. Arcuate fasciculus
- C. Arcuate fibers
- D. None of the above

3- Initiation of movement of muscles in the hand & arms required for writing a particular word ?

- A. Hand skills area
- B. Motor cortex
- C. Arcuate fasciculus
- D. Angular area

4- Patient will understand spoken & written words but find it difficult to speak or to write:

- A. Non fluent aphasia
- B. Sensory aphasia
- C. Conductive aphasia
- D. Fluent aphasia

5- Recognition of emotion in ?

- A. Right hemisphere
- B. Left hemisphere
- C. Both
- D. Cerebellum

6- Interruption in the flow of the visual process into W. area from visual area ?

- A. Sensory aphasia
- B. Non fluent aphasia
- C. Dyslexia
- D. Conductive aphasia

7- Produce and understand language by ?

- A. Right hemisphere
- B. Left hemisphere
- C. Both
- D. Cerebellum

8- Location of Angular Gyrus ?

- A. In front of Wernicke's area
- B. Lies behind Broca's area
- C. Lies behind Wernicke's area
- D. At the lower end of premotor area

1- List two brain areas involved in language and define their functions ?

- **Wernicke's area** : comprehension of auditory & visual information
- **Arcuate fasciculus** : Conduction
- **Broca's area**: Process information received from W. area into detailed & co-ordinated pattern
- **Angular Gyrus** : interpretation of information obtained from reading from visual cortex

2- Which type of aphasia has abnormal visual comprehension ?

Anomic aphasia.

3- Where is Wernicke's area located?

At the posterior end of the superior gyrus of the temporal lobe.

4- Which area is effected in motor aphasia?

Broca's area.

5- What is the function of motor cortex ?

To initiate the appropriate movement of muscle of speech in tongue, larynx & lips.

6- What do we call the bundle of axons connecting the Wernicke's area to the Broca's area?

Arcuate fasciculus.

THANK YOU FOR CHECKING OUR WORK!

BEST OF LUCK

aphasia

COMMUNICATING THROUGH THE BARRIERS.

What is Aphasia?
Aphasia is a language disorder that affects the ability to communicate. It's most often caused by injury to parts of the brain that control speech and language resulting from a stroke.

I need to communicate with someone who has aphasia.

- Keep It Simple**
Speak in short, simple sentences.
- Be Patient**
Allow plenty of time for a response. Talk with him/her not for him/her.
- Remove Distractions**
Turn off radios and TVs.
- Be Creative**
Try writing, gesturing, pictures and communication tools like an iPad.
- Confirm**
Repeat back what you think he/she is saying.

People With Aphasia

1. Communicate differently, but they are as smart as they were before.
2. Their hearing is fine; speaking loudly does not help.
3. Aphasia is not contagious! To talk to people with aphasia, you'll just have to communicate differently.

I have aphasia.

- Take Your Time**
Remember it may take a while to get the words out.
- Let People Know What Works Best For You**
Do you want a question asked in multiple ways? Let them know.
- Use Assistive Devices**
Bring photos, diagrams, pen and paper, etc.
- Getting Frustrated Is Okay**
Don't blame yourself if you get stuck or stumble on your words. Be patient with yourself as you find what works.

If You Get Stuck, You Can

1. Admit you're struggling.
2. Recap what you have discussed so far.
3. Decide whether to carry on or come back to it later.
