

# Normal flora & Diarrhea

### Introduction to Normal Flora:

- Normal flora are microorganisms that are frequently **found** in various body sites in **normal healthy individuals**.
- Constituents and number vary according to the **age** and **physiologic status**.
- Able to **colonize and multiply** under the existing condition of different body sites.
- **Inhibit** competing intruders.
- Have **symbiotic relationship** that benefit the host.
- Can cause disease in **immunocompromized** patients.

### Normal Flora of The GIT:

- **The oral cavity:** contain **very high number** which varies from site to site of the mouth.
- **Saliva:** contain mixed flora **10x8** organism /ml.
- **Stomach:** **very few** in health due to HCL and peptic enzymes.
- **Small intestine:** very **scanty** except near colon.
- **Colon of adults:** **10x 10** org/gm stool
  - >90% are *Bacteriodes* ( anaerobic)
  - 10 % other bacteria.
- Direct effect of **diet** composition.

<b>Normal Flora of GIT:</b>	<b>Normal flora ( low virulence)</b>	<b>Potential pathogen (carrier)</b>
<b>Mouth:</b>	Viridans streptococci, <i>Neisseria</i> spp., <i>Moraxella</i> , <i>Peptostreptococcus</i> .	<i>Candida albicans</i> .
<b>Nasopharynx:</b>	<i>Niesseria</i> spp., Viridans sterpt. <i>Moraxella</i> , <i>Peptostreptococcus</i> .	<i>S.pneumoniae</i> , <i>N.meningitidis</i> , <i>H.influenzae</i> , <i>S.pyogenes</i> , <i>S.aureus</i> .
<b>Stomach:</b>	Streptococci, <i>Peptosterptococcus</i> , others from mouth.	None.
<b>Small intestine:</b>	Scanty, variable.	None.
<b>Colon of adults:</b>	<i>Bacteriodes</i> , <i>Fusobacterium</i> , <i>Bifidobacteria</i> , <i>Lactobacillus</i> , enterobacteria, <i>Clostridium</i> .	<i>B.fragilis</i> , <i>E.coli</i> , <i>Pesudomonas</i> , <i>Candida</i> , <i>Clostridium</i> .
<b>Colon of Breastfeeding infants:</b>	<i>Bifidobacterium</i> , <i>Lactobacillus</i> .	None.

### Role Of GIT Normal Flora In Disease:

- Many are **opportunistic pathogens**
  - **E.g. perforation of the colon from ruptured diverticulum**, feces enters into peritoneal cavity and cause peritonitis.
- **Viridans strept.** of oral cavity enters blood and colonize damaged heart valves.
- **Mouth flora** play a role in dental caries.
- **Compromised defense systems** increase the opportunity for invasion.
- **Death** after lethal dose of radiation due to massive invasion of normal flora.

## Role of Normal Flora In Diarrheal Diseases:

- *E.coli* is the **most common** Enterobacteriaceae , a facultative flora of colon followed by **Klebsiella, Proteus and Enterobacteria**.
- **Salmonella, Shigella** and *Yersinia* are **NOT** a normal flora of the intestinal tract.
- Some strains of **E.coli ,Salmonella ,Shigella and Yersinia enterocolitica** are able to cause **diseases** in the intestinal tract. Found in small amounts

## Intestinal Pathogens:

- **Invasive and cytotoxic strains** produce inflammatory diarrhea (**Dysentery**) with **WBCs** and /or **blood** in the stool.
- **Enterotoxin –producing strains** cause **watery** diarrhea with loss of fluid.
- Some produce **systemic illness** due to spread to multiple organs such as **enteric (typhoid) fever**.

## Acute Diarrheal Illnesses And Food Poisoning:

### Background:

- **Acute diarrheal illness** is one of **the most common** problems evaluated by clinicians.
- A major cause of **morbidity** and **mortality** worldwide.
- Most of healthy people have mild illness but others might develop serious squeals so it is important to **identify those individuals who require early treatment**.

### Definitions of Diarrhea:

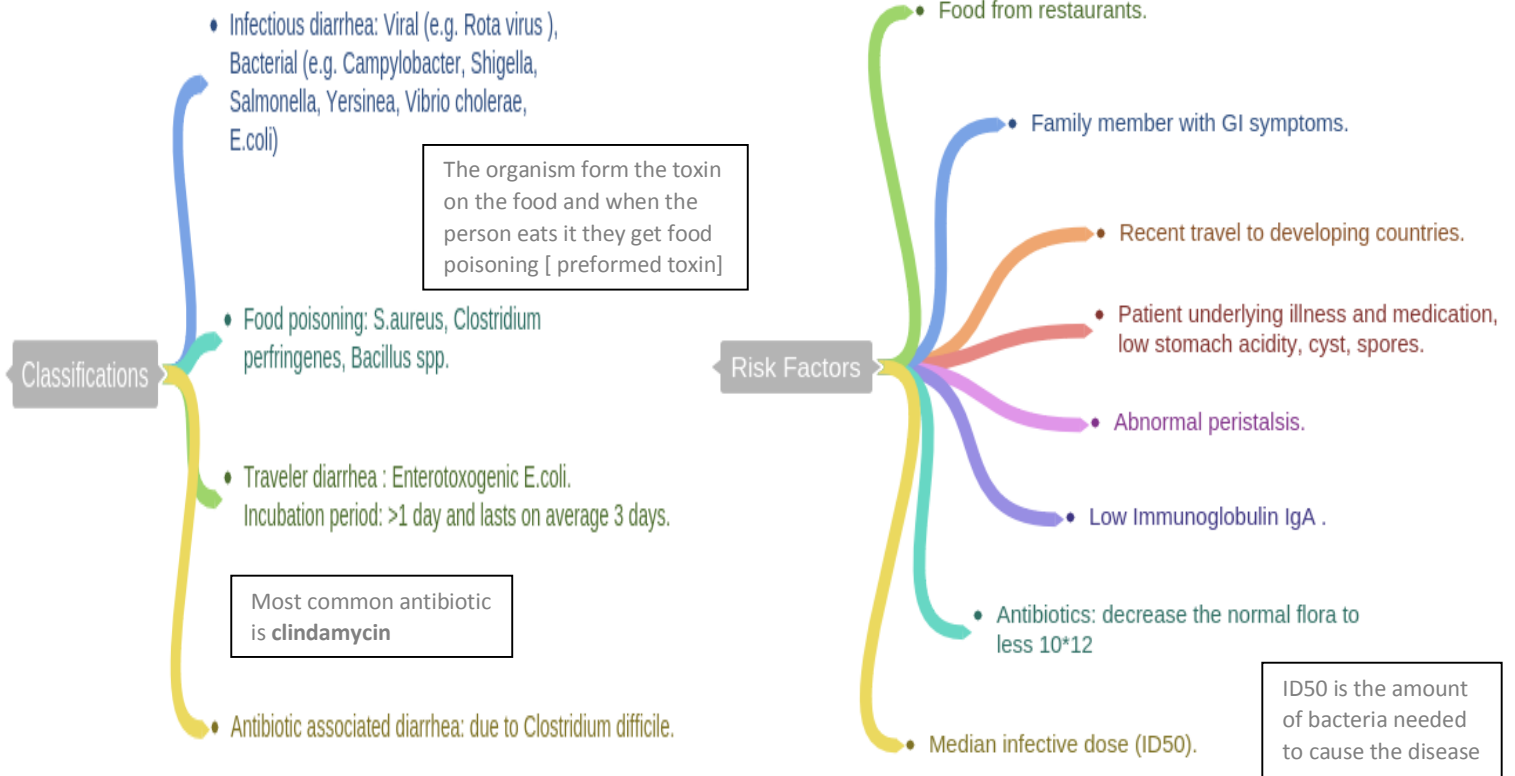

- **Stool weight** in excess of 200 gm/day.
- Three or more **loose** or **watery** stools/day.
- Alteration in normal bowel movement characterized by **decreased consistency** and **increased frequency**.
- **Less** than 14 days in duration.

### Etiology:

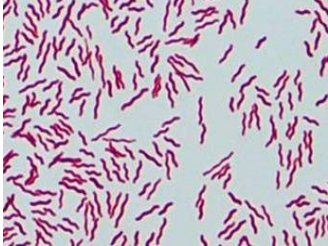

- **Viral: 70-80%** of infectious diarrhea in developed countries.
- **Bacterial: 10-20%** of infectious diarrhea but responsible for **most cases of severe** diarrhea.
- **Protozoan:** less than **10%**.

### Epidemiology:

- **1.2 - 1.9 episodes** per **person** annually in the general population.
- **2.4 episodes** per **child <3 years** old annually.
- **5 episodes** per year for **children <3 years** old in daycare.
- Seasonal peak in the **winter**.

<b>Clinical Presentation and Pathogenic:</b>	
<b>Mechanism I Enterotoxin mediated [ non inflammatory ]</b>	<b>Mechanism II Invasive [ inflammatory ]</b>
<b>Lack</b> of pus in the stool (no gut invasion)	<b>Pus and blood</b> in the stool
<b>Lack</b> of fever	<b>Fever</b> due to inflammation
<b>Rapid</b> onset of preformed toxin : <12 hrs	Incubation period 1-3 days [ shorter ]
<b>Small intestine</b> affected	Affect <b>colonic mucosal surface</b> of the bowel
Vomiting , <b>non-blood</b> y diarrhea, abdominal cramps.	Dysentery syndrome- <b>gross blood and mucous EHEC</b> [ enterohemorrhagic E.coli ] <b>bloody</b> diarrhea
<b>Vibrio cholerae, Staphylococcus aureus, Clostridium perfringens and Bacillus cereus</b> [ toxin forming ]	<b>Shigella, Salmonella spp., Campylobacter, some E.coli and Entameoba histolytica</b>
Other viral and some parasitic infections.	<b>Entameoba histolytica</b> 1-3 wk
-	Extension to lymph nodes

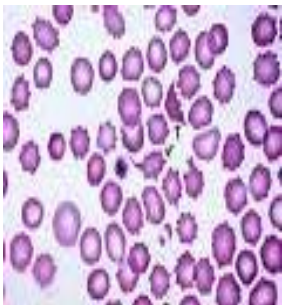

<b>Campylobacter</b>	
<b>Family</b>	Campylobacteraceae.
<b>Genus</b>	Archobacter-spiral shape.
<b>Common species</b>	<b>C. jejuni</b> , <b>C. coli</b> , <b>C fetus</b> .
<b>Source</b>	Dog , cat, birds, <b>poultry</b> ,water, milk, meat, person to person transmission can occur.
<b>Pictures</b>	   <p>[ blood agar w/ antibiotics to inhibit other non pathogenic bacterial growth ]</p> <p style="text-align: right;">spiral shape</p>
<b>Clinically</b>	<p style="text-align: center;"><b>Incubation period: 2- 6 days</b></p> <p style="text-align: center;">Take a stool sample [ stool is full of bacteria that's why we look for pathogens there ]</p> <p style="text-align: center;">Abdominal cramps – <b>bloody</b> diahrea – nausea and vomiting are <b>rare</b></p> <p style="text-align: center;">Self limiting after 2 – 6 days</p> <p style="text-align: center;">Chronic carrier</p> <p style="text-align: center;"><u>Guailian barrie syndrom</u> and <u>reactive arthritis</u> may result</p>
<b>Laboratory diagnosis</b>	<p style="text-align: center;"><b>Transport media: Cary blair</b></p> <p style="text-align: center;"><b>Campybab</b> [ blood agar ] contain antibiotics</p> <p style="text-align: center;">Incubate in [ 5% O2 – 10% CO2 – 85% N – 42 C except C.fetus 37 C ]</p> <p style="text-align: center;">We mostly look for the most common organisms [ dhigilla – salmonella – cambylobacter ]</p> <p style="text-align: center;">The most common virus seen I the lab is [ Rotaa virus ]</p>
<b>Treatment</b>	<p style="text-align: center;"><b>Resistance to CIPROFLOXACIN</b></p> <p style="text-align: center;"><b>Sensetive to ERYTHROMYCIN – TETRACYCLIN</b></p>

### E.coli:

- Only about **10 -15%** strains of *E. coli* strains are associated with diarrhea.
- Based on virulence factors, clinical manifestation, epidemiology and **different O and H serotypes**.

- There are **Five** major categories of diarrheagenic *E.coli*:
  1. **Enterotoxigenic E.coli (ETEC)**
  2. **Enteroinvasive E.coli ( EIEC)**
  3. **Enterohemorrhagic E.coli ( EHEC)**
  4. **Enteroadherent E.coli (EAEC)**
  5. **Enteropathogenic E.coli (EPEC)**

Enterotoxigenic <i>E. coli</i> ( ETEC )	Enteroinvasive <i>E. coli</i> ( EIEC)
<ul style="list-style-type: none"> <li>Major cause of <b>traveler's</b> diarrhea in <b>infant and adult</b> in developing countries from <b>contaminated food and water</b></li> <li><b>It has high infective dose <math>10^6</math>-<math>10^{10}</math></b></li> <li>Produce: <ul style="list-style-type: none"> <li><b>heat-labile toxin</b> (LT) leads to accumulation of C-GMP, which lead to hypersecretion.</li> <li><b>heat-stable toxin</b> (ST) <b>each has two fragment (A and B)</b> A → Active part / B → Binding part</li> </ul> </li> <li><b>Symptoms</b> :watery diarrhea, abdominal cramps and sometimes vomiting</li> <li>No routine diagnostic method. [ self limiting – Hx of travel could be a key for diagnosis ]</li> </ul>	<ul style="list-style-type: none"> <li>Produce <b>dysentery</b> (<b>penetration, invasion and distraction</b>)</li> <li>Similar to <b><i>Shigella spp.</i></b> (<b>non motile, non-lactose fermenter</b>)</li> <li><b>Fecal -oral route</b></li> <li>Fever, severe abdominal cramps, malaise and watery diarrhea</li> <li>Infective dose = <math>10^6</math></li> <li>Diagnosis : <b>Sereny test</b> and <b>DNA probes</b>.</li> <li>❖ Sereny test: [ incubation of the bacteria into an animals eye ]</li> </ul> 
Enteropathogenic <i>E. coli</i> (EPEC)	Enterohemorrhagic <i>E. coli</i> ( EHEC)
<ul style="list-style-type: none"> <li><b>Infantile</b> diarrhea</li> <li>Cause <b>outbreak</b> in hospital nurseries and day care centers.</li> <li>Low grade fever, malaise, vomiting and diarrhea.</li> <li><b>Mucous</b> in stool but <b>no blood</b>.</li> </ul>	<ul style="list-style-type: none"> <li><b>O157:H7</b> : <ul style="list-style-type: none"> <li>Hemorrhagic diarrhea</li> <li>Colitis</li> <li><b>hemolytic uremic syndrome (HUS)</b>: [ <b>low Platelet count, hemolytic anemia and kidney failure</b> ]</li> </ul> </li> <li><b>Bloody</b> diarrhea, low grade <b>fever</b> and stool has <b>no leucocytes</b></li> <li><b>Fatal</b> disease in young and elderly persons in nursing homes</li> <li>Transmitted through consumption of: <ul style="list-style-type: none"> <li>undercooked hamburgers</li> <li>unpasteurized dairy products</li> <li>apple cider</li> <li>cookie dough</li> </ul> </li> <li><b>Cytotoxin = Verotoxin I and Verotoxin II similar to (Shiga-toxin I &amp;II)</b></li> <li><i>E. coli</i> other than <b>O157:H7</b> can cause <b>HUS</b></li> <li>Diagnosis by culture on <b>SMAC</b>(<i>sorbitol MacConkey agar cefixime</i>), Verotoxin detection by <b>immunological test</b> or <b>PCR</b>.</li> <li><b>HUS</b>: Hamburger disease</li> </ul>  
Enteroadherent <i>E. coli</i> (EAEC)	
<ul style="list-style-type: none"> <li><b>Pediatric</b> diarrheal disease</li> <li><b>Adhering</b> to the surface of the intestinal mucosa ,can <b>cause UTI</b>.</li> <li>Aggregative stacked brick in the mucosa</li> <li>Watery diarrhea, vomiting, dehydration and abdominal pain for two or more weeks</li> </ul>	

Distruction of RBCs + low PLTs

- A: produces the toxin and injects it inside the cell
- B: Pedestal formation [ أقدام كاذبة ] and destroys the mucosa
- C: most serious one because it invades – destroys – spread to other cells
- D: Forms toxin – Destroy the cell

**Yersinia enterocolitica:**

- Mesenteric lymphadenitis → children
- septicemia → immunocompromized hosts
- Common in Europe, USA, Canada . Cats, dogs & swine (chitterlings)
- Survive **cold temperatures** and associated with transfusion of packed red blood cells.
- **Present with enteritis, arthritis and erythema nodosum** [ not all of them are GIT symptoms ]
- Generalize infection in adult and children 1-5 yrs, usually mild but in old children and adult it **mimic appendicitis**
- Grow at **25°-30°C** .
- **Media:** Cefsulodin-Igrasan-Novobiocin.

**Clostridium difficile:**

**Antibiotic associated diarrhea:** [ Clindamycin ]

- Transmit from person to person via **fecal-oral** route
- Have been cultured from inanimate hospital surfaces
- Disruption of the indigenous bacterial flora of the colon
- Produce **toxin A and B** that can bind to surface epithelial cell receptors leading to inflammation, mucosal injury and diarrhea.
- Patient presents with **fever, leukocytosis, abdominal pain and diarrhea**
- **Pseudomembrane (consists of neutrophils, fibrin, and cellular debris in the colonic mucosa) and toxic megacolon**
- **Diagnosis:** toxin detection by enzyme immunoassay (EIA)
- **Treatment :** **Metronidazole ± Vancomycin** and supportive treatment

Spores

Endoscopy: Pus cells w/ severe inflammation

Blood agar

**Selected Clinical and Epidemiologic Characteristics of Typical Illness Caused By Common Foodborne Pathogens\***

Pathogen	Typical Incubation Period	Duration	Typical Clinical Presentation	Assorted Foods
<b>Bacterial</b>				
<i>Salmonella species</i>	1-3 Days	4-7 Days	Gastroenteritis	Undercooked <b>eggs or poultry</b> , produce
<i>Campylobacter jejuni</i>	2-5 Days	2-10 Days	Gastroenteritis	Undercooked <b>poultry</b> , unpasteurized <b>dairy</b> products
<i>E. coli, Enterotoxigenic</i>	1-3 Days	3-7 Days	Gastroenteritis	Many foods
<i>Shigella species</i>	1-2 Days	4-7 Days	Gastroenteritis	Produce, egg salad
<i>Listeria monocytogenes</i>	2-6 weeks	Variable	Gastroenteritis, meningitis abortion	Deli meat, hotdogs, unpasteurized dairy products
<i>Bacillus cereus</i>	1-6 hour	<24 hour	Vomiting, Gastroenteritis	Fried rice, meats
<i>Clostridium botulinum</i>	12-72 hour	Days- months	Blurred vision, paralysis	Home-canned foods, fermented fish
<i>Staphylococcus aureus</i>	1-6 hour	1-2 Days	Gastroenteritis, particularly nausea	Meats, potato & pork, unpasteurized dairy products.
<i>Yersinia enterocolitica</i>	1-2 Days	1-3 weeks	Gastroenteritis, appendicitis- like syndrome	Undercooked pork, unpasteurized dairy products.

**ESCHERICHIA  
COLI**

Hey, my name is E. coli.  
I'm a Gram negative bacteria and I'm part of the enterbacteriaceae family.  
In my family I am part of tribe I, Escherichieae.  
My whole family is oxidase negative.  
I live in the bowels.

My uropathic strains are the most common cause of urinary tract infection. For teh win!  
Some of my strains have virulence factors, so I can cause diarrhoea.  
The diarrhoea can watery or bloody, depending on which strain you have.

Hola. I'm C. jejuni.  
I am a curved Gram Negative rod.

You can find me in lots of domestic animals.  
I am part of the normal bacterial flora of poultry and cattle.  
I get into people through dirty drinking water or undercooked meat, especially chicken.  
I cause food poisoning, with a self limiting bloody diarrhoea, abdominal cramps and fever.

**CAMPYLOBACTER  
JEJUNI**

Hey there, my name is *Y. enterocolitica*.  
I'm Gram negative, an Enterobacteriaceae  
bacteria.  
I'm part of the tribe Yersiniiae.

I'm not as well known as my cousin *Y. pestis*,  
but I'm still important.  
I get to you in food and I love pork.  
I can cause abdominal pain and diarrhoea.  
Kids are my favourite.

But look out! when I infect your lymph  
nodes and your ileum, I can look just like  
appendicitis.

YERSINIA  
ENTEROCOLITICA

Hello, my name is *C. difficile*.  
I'm an anaerobic, Gram Positive  
rod that can make spores.  
I live in your digestive tract.

I cause pseudomembranous  
colitis.  
Sometimes if you take broad  
spectrum antibiotics (especially  
clindamycin and the  
cephalosporins) you kill off your  
friendly bacteria.  
That leaves lots of room for me.  
I make toxins that cause very  
bad inflammation.  
You get diarrhoea, abdominal  
pain and a fever.

CLOSTRIDIUM  
DIFFICILE

I covered myself in a white  
membrane like coating that can be seen on the inside of your intestines.

## MCQs:

**1-A patient was hospitalized after an automobile accident. The wounds became infected and the patient was treated with Tobramycin, Carbenicillin, and Clindamycin. Five days after antibiotic therapy was initiated the patient developed severe diarrhea and pseudomembranous enterocolitis. Antibiotic-associated diarrhea and the more serious pseudomembranous enterocolitis can be caused by:**

- A- *Clostridium sordelli*      B-*Clostridium perfringens*      C-*Clostridium difficile*      D-*Staphylococcus aureus*

**2-A box of ham sandwiches with mayonnaise prepared by a person with a boil on his neck was left out of the refrigerator for the on call interns. Three doctors became violently ill approximately 2 h after eating the sandwiches. The most likely cause is:**

- A- *Staphylococcus aureus* enterotoxin      B-Coagulase from *Staphylococcus aureus* in the ham  
C-*Staphylococcus aureus* leukocidin      D-*Clostridium perfringens* toxin

**3-Symptoms of *Clostridium botulinum* food poisoning include double vision, inability to speak, and respiratory paralysis. These symptoms are consistent with:**

- A-Invasion of the gut epithelium by *C.botulinum*      B-Secretion of an enterotoxin  
C-Endotoxin shock      D-Ingestion of a neurotoxin

**4-The treatment of choice for a patient with *Campylobacter jejuni* enterocolitis is:**

- A-Erythromycin      B-Ciprofloxacin      C-Ampicillin      D-Pepto-Bismol

5-A 2-year-old infant was brought to the emergency room with hemolytic uremic syndrome and thrombocytopenia. Which of the following bacteria would most likely be isolated from a stool specimen?

A-Shigella

B-Salmonella

C-Aeromonas

D-Escherichia coli 0157/H7

6-E. coli causes disease by a variety of different methods. Which one of the following E. coli types is characterized by the presence of LT (heat-labile) and ST (heat-stable) proteins?

A-Enteroinvasive (EIEC)

B-Enterotoxigenic(ETEC)

C-Enterohemorrhagic(EHEC)

D-Enteropathgenic(EPEC)

7-For each of the following body sites, choose that bacterium that is the predominant normal flora (indigenous organism)

A-Alpha-Hemolytic streptococci

1-Skin

B-Lactobacillus

2-Mouth

C-Staphylococcus epidermis

3-Bowel

D-Escherichia coli

4-Vagina

E-Bacteroides fragilis

ANSWERS:

1- C 2- A 3- D 4- A 5- D 6 - B 7- SKIN (C) , MOUTH (A) , BOWEL (E) , VAGINA (B)
