# Final Reproductive Pharmacology Revision

#### Done by:

OMAR ALRAHBEENI, KHALID ALDURAIBI, REEMA ALNASSER, NOUF ALMASOUD and MAHA ALRABIAH

#### Lecture 2: Oral and Other Forms of Contraception

# Combined Pills (COC) Contains both Estrogen & Progestin Norgestimate, Desogestrel and Drospirenone

Norgestimate, Desogestrel and Drospirenone							
MOA	ADRs	C.I.	Interactions	Туре	Comments		
- Inhibit ovulation by ↓ (FSH & LH) ⇒ no action on the ovary ⇒ ovulation is prevented Inhibit	Related to Estrogen: - Impair glucose tolerance (hyperglycemia) ↑ Incidence of breast, vaginal & cervical cancer Cardiovascular: A. Thromboembolism.	<ul> <li>Thrombophlebitis / thromboembolic disorders</li> <li>CHF or other causes of edema.</li> <li>Vaginal bleeding.</li> <li>Known or suspected pregnancy.</li> <li>Known or suspected breast cancer, or estrogen-dependent neoplasms.</li> </ul>	Medications that cause contraceptive failure:  1. Impairing absorption:    Antibiotics  2. CYT P450 Inducers:    Phenytoin,    Phenobarbitone,    & Rifampin  Medications that    ↑ COC toxicity:	M O N T H L	<ol> <li>Methods of administration:         <ol> <li>Taken same time of day.</li> <li>For 21 days (start on day 5 → end on day 26).</li> <li>7 days pill free period.</li> </ol> </li> <li>To improve compliance: a formulation of 28 pills         <ol> <li>The first 21 pills are of multiphasic formulation.</li> <li>Followed by the last 7 pills are actually placebo.</li> </ol> </li> </ol>		
<ul> <li>Inhibit implantation.</li> <li>Increase viscosity of the cervical mucus.</li> <li>Abnormal transport time through the fallopian tubes.</li> </ul>	Related to Progestin: - Fatigue, depression of mood Weight gain Hirsutism Masculinization (Norethindrone) Ectopic pregnancy.	<ul> <li>Impaired hepatic functions.</li> <li>Dyslipidemia, diabetes, hypertension, migraine.</li> <li>Lactating mothers*</li> <li>Obese*</li> <li>Smoker*</li> <li>Females &gt; 35 years*</li> <li>*(better given progestin only pills ''minipills'')</li> </ul>	Medications that  ↑ COC toxicity:  1. CYT P450    Inhibitors:    Acetaminophen,    Erythromycin.  Medications altered in clearance ↓ by COC:  1. ↑ In their toxicity:    Warfarin,    Cyclosporine,    Theophyline	S E A S O N A L	<ul> <li>Cover 91 days Schedule (84 days breaking by 7 days).</li> <li>Low doses of both estrogens and progestins are known as Continuous / Extended cycle</li> <li>Benefits:         <ul> <li>Periods only 4 times a year.</li> <li>Useful in: pre-menestrual or menstrual disorder and perimenopausal women with vasomotor symptoms.</li> </ul> </li> <li>Disadvantages:         <ul> <li>Higher incidence of breakthrough bleeding &amp; spotting during early use.</li> </ul> </li> </ul>		

# Cont.: Oral and other forms of contraception

Morning-After Pill / Post Coital Contraception Contraception on instantaneous demand, 2 <sup>ndry</sup> to unprotected sexual intercourse.			Mini Pills / Progestin-Only Pills (POP) Norethindrone, Levonorgestrel (Norgestrel), Medroxyprogesterone acetate			
Composition	Administration	Indications	MOA Indications		Instructions	
Ethinyl estadiol + Levonorgestrel	2 tablets twice with 12 hrs in between.	When desirability for avoiding pregnancy is obvious:		Are alternative when oestrogen is	- Should be taken every day, the same time, all year round I.M injection e.g. medroxyprogesterone	
High-dose only Ethinyl estadiol	Twice daily for 5 days.	<ul><li>Unsuccessful withdrawal.</li><li>before ejaculation.</li><li>Torn, leaking condom.</li></ul>	Increase cervical mucus, so no sperm penetration & therefore, no fertilization.	contraindicated: - During breast feeding - Hypertension - Cancer - Smokers over the age		
High dose only levonorgestrel	Twice daily for 5 days.	<ul><li>- Missed pills.</li><li>- Exposure to teratogen.</li><li>e.g. Live vaccine.</li></ul>				
Mifepristone ± Misoprostol	A single dose .	- Rape.		of 30		

# Lecture 3: Drugs inducing ovulation

Class	Drug	MOA / Composition	Indications	Administration	ADRs
Antiestroge ns SERMs	Clomiphene	↑ Negative feedback of endogenous estrogen on hypothalamus and anterior pituitry ⇒ ↑ GnRH ⇒ ↑ FSH & LH ⇒ OVULATION!	-Female infertility (Normogonadotropic).	-Given from 5 <sup>th</sup> to 10 <sup>th</sup> day of the cycle. -Can not be repeated more than 3 cycles.	<ul> <li>Hot Flushes &amp; breast tenderness.</li> <li>Visual disturbances (reversible).</li> <li>↑ Nervous tension &amp; depression.</li> <li>Weight gain.</li> <li>Hair loss (reversible).</li> <li>High incidence of multiple birth.</li> </ul>
	Tamoxifen	Similar to Clomiphene But Non-steroidal.	-Women with PCOS and clomiphene-resistant casesEstrogen receptor- positive breast cancer.	-	-
GnRH agonists	Leuprolin & Goserelin	-	-Female infertility due to hypothalamic amenorrhea (GnRH deficient).	-Given S.C. in a pulsatile drip to stimulate gonadotropinRelease Start from day 2-3 of cycle up to day 10.  - Given continuously, when gonadal suppression is desirable e.g.: - Precocious puberty Breast cancer in women Prostatic cancer in men.	- Headache Hypoestrogenism on long term use:     ○ Hot flashes.     ○ ↓ Libido.     ○ Osteoporosis.     ○ Rarely ovarian hyperstimulation.     (ovaries swell &enlarge)
Gonado-	Menotropin (hMG)	Extracted from postmenopausal urine (contains LH & FSH).	-Female infertility 2ndry to gonadotropin deficiency	I.M. daily starting at day 2-3 of cycle for 10 days.	<ul> <li>FSH containing preparations:</li> <li>Fever.</li> <li>Ovarian enlargement (hyperstimulation).</li> </ul>
trophins	Pregnyl (hCG)	Extracted from pregnant women urine (contains mainly LH).	(pituitary insufficiency).	Given on 10 <sup>th</sup> - 12 <sup>th</sup> day for Ovum retrieval.	<ul> <li>Multiple Pregnancy.</li> <li>LH containing preparations:</li> <li>Headache and Edema.</li> </ul>
D2 R Agonists	Bromocreptine Ergot derivative (Not a hormone)	D2R agonists binds to dopamine receptors in the AP gland ⇒ inhibits prolactin secretion.	-Female infertility 2ndary to hyperprolactinemia.	-	

# Lecture 4: oxytocics and Tocolytics

	Oxytocics							
Class		Drugs	MOA	Indications	ADRs	C.I	Kinetics	
Synthetic Oxytocin	C Syntocinon		<ul> <li>Interaction of oxytocin with myometrial receptor → influx of ca <sup>++</sup> from ECF and from S.R. → stimulates uterine contraction particularly in the fundus.</li> <li>Resemble normal physiological contraction</li> <li>Milk ejection.</li> </ul>	1. Induction & augmentation of labor: - Mild preeclampsia near term Uterine inertia Incomplete abortion Post maturity Maternal diabetes. 2. Postpartum uterine hemorrhage (I.V drip). 3. Impaired milk ejection.	- Maternal death due to hypertension - Uterine rupture Fetal death (ischemia) Water intoxication (if given with large volumes of electrolyte-free aqueous fluid intravenously).	<ul> <li>Hypersensitivity.</li> <li>Prematurity.</li> <li>Abnormal fetal position.</li> <li>Fetal distress.</li> <li>Cephalopelvic disproportion.</li> <li>Incompletely dilated cervix.</li> <li>Precautions:</li> <li>Multiple pregnancy.</li> <li>Previous c- section.</li> <li>Hypertension</li> </ul>	- Given when uterine cervix is soft and dilated Not effective orally I.V. (augment labor) - Nasal spray (impaired milk ejection).	
Ergot	Natural: Ergometrine (Ergonovine)		Tetanic Contraction of the whole uterus without relaxation in	Only in Postpartum	- Nausea, vomiting, diarrhea. - HTN:	<ul> <li>Induction of labour: (1st and 2nd stage of labor).</li> <li>Vascular disease</li> </ul>	- I.M - Metabolized in liver. - Excreted in bile.	
Alkaloids Synthet  Methyl ergon		Synthetic I ergometrine ylergonovine)	between (tend to compress rather than to expel the fetus).	hemorrhage (3 <sup>rd</sup> stage of labor)	<ul><li>Vasoconstriction of peripheral blood vessels.</li><li>Gangrene.</li></ul>	<ul><li>Severe hepatic and renal impairment.</li><li>Severe hypertension.</li></ul>	Preparations: Syntometrine: is a combination of oxytocin and ergometrine(I.M)	
PGE2		Dinoprostone	- Contract uterine smooth muscle throughout	-Induce abortion in 2 <sup>nd</sup> trimester of pregnancyInduction of labor	<ul><li>Nausea , vomiting</li><li>Abdominal pain.</li><li>Diarrhea.</li><li>Flushing (PGE2)</li></ul>	<ul><li>Mechanical obstruction of delivery.</li><li>Fetal distress</li><li>Predisposition to uterine rupture.</li></ul>	<ul><li>- Vaginal suppository.</li><li>- Extra- amniotic solution.</li><li>- Longer duration of action than oxytocin.</li></ul>	
glandins	PGE2α	Dinoprost	pregnancy Soften the cervix.	(fetal death in utero).	- Bronchospasm.	• <u>Precautions:</u> - Asthma.	Intra-amniotic injection.	
	505/	Carboprost		-Postpartum hemorrhage.		<ul><li> Multiple pregnancy.</li><li> Glaucoma.</li></ul>		
	PGE1	Misoprostol			-	- Uterine rupture.		

# **Cont.:** oxytocics and Tocolytics

Tocolytics								
Class	Drugs	MOA	Indication	ADRs	Kinetics			
$\begin{array}{c} \textbf{Selective} \ \ \beta_2 \\ \textbf{adrenoceptor} \\ \textbf{agonist} \end{array}$	Ritodrine	- Bind to β-adrenoceptors → activate enzyme Adenylate cyclase → ↑ cAMP → ↓ intracellular calcium level Specific as uterine relaxant	- Relax the uterus. - Arrest	<ul><li>Tremor, Nausea, vomiting.</li><li>Flushing, Sweating.</li><li>Tachycardia (high dose).</li><li>Hypotension, Hyperglycemia.</li><li>Hypokalaemia.</li></ul>	I.V Drip			
Calcium channel Blockers	Nifedipine	<ul> <li>Inhibits the amplitude of spontaneous and oxytocin-induced contractions.</li> <li>Cause relaxation of myometrium.</li> </ul>	threatened abortion. - Delay premature labour.	<ul><li>Headache, Dizziness, Hypotension.</li><li>Flushing.</li><li>Constipation.</li><li>Ankle edema.</li><li>Coughing, Wheezing.</li><li>Tachycardia.</li></ul>	-			
Atosiban	Atosiban	Compete with oxytocin at its receptors on the uterus.		-	IV infusion for 48 hrs			

#### Lecture 5: Teratogens & drugs of abuse in pregnancy

Physio-chemical properties of the drugs					
Lipid solubility	<ol> <li>Lipophilic drugs: Thiopental → crosses placenta &amp; causes sedation, apnea in newborn infants.</li> <li>Ionized drugs: cross the placenta very slowly e.g Succinylcholine &amp; pancuronium.</li> </ol>				
Molecular Weight	<b>Heparin</b> : High molecular weight → cannot cross placenta.				
Protein Binding	High protein binding prevents the drug to go to placenta: propylthiouracil and chloramphenicol.				

	FDA Classification System					
Categories	In animals	In humans	Use in pregnancy	Examples		
Category A	-	NO risk	✓	Folic acid, Thyroxine		
Category B	NO risk	NO data	✓	Paracetamol, Erythromycin		
Category C	Adverse effect	NO data	Used in serious situation despite its potential risk	Morphine		
Category D	-	Adverse effect	Used in serious diseases or life threatening situations	Antiepileptics		
Category X	Fetal abnormalities	Fetal abnormalities	Teratogenic and contraindicated.	<ul> <li>Retinoids: vitamin A (700 μg/day) &amp; isotretinoin.</li> <li>Cytotoxic drugs: Folate antagonists (methotrexate) &amp; Alkylating agents (cyclophosphamide).</li> <li>Anticonvulsant drugs (valproic acid, phenytoin, carbamazepines).</li> <li>Anticoagulants (warfarin).</li> <li>Antibiotics (tetracyclines, quinolones).</li> <li>Thalidomide, Lithium, Alcohols, ACEIs, Ionizing radiation, Radioactive iodine (I131), Corticosteroids, Hormones.</li> </ul>		

# Cont.: Teratogens & drugs of abuse in pregnancy

Category X "Proven teratogens"							
Ą	gent	Teratogenesis (During 1st trimesters)	Age	nt	Adverse effects (During 2 <sup>nd</sup> & 3 <sup>rd</sup> trimesters)		
Thali	idomide	Phocomelia: shortened/absent long bones of limbs.	Antibiotics	Aminoglycosides Streptomycin Kanamycin	Ototoxicity = 8th Cranial nerve damage.		
Phe	enytoin	Fetal Hydantoin Syndrome: digital hypoplasia.	Chloramp	henicol	Gray baby syndrome.		
Valpr	oic acid	Spina bifida & impairs folate absorption.	Sulfona	mides	Neonatal hyperbilirubinemia (jaundice).		
Lit	thium	Ebstein's anomaly: CVS anomalies.	β- Bloc Propra		<ul> <li>-Placental insufficiency→ ↓ uterine blood flow → fetal distress.</li> <li>-Neonatal hypoglycemia,</li> </ul>		
Tetra	cyclines	Altered growth of teeth and bones, teeth staining and enamel hypoplasia.	Tetracyclines		Impaired teeth and bone development, discoloration of teeth.		
Wa	rfarin	Hypoplasia of nasal bridge & CNS malformation.	Warfarin		Risk of bleeding.		
Cortic	osteroids	Cleft lip and Palate.	Corticosteroids		Adrenal atrophy $ ightarrow$ growth retardation.		
	Estrogens	Testicular atrophy in male fetus.	Antithyroid	lodide. Methimazole Carbimazole Propylthiouracil	Risk of neonatal hypothyroidism and goiter.		
Hormones	Androgens Fetal masculinization in female fetus.  NSAIDs  Aspirin. Indomethacir		Aspirin. Indomethacin	<ul> <li>-PG synthesis inhibitors: Constriction of ductus arteriosus, pulmonary HTN.</li> <li>-↑ Gestation time and prolonged labor.</li> <li>-Postpartum hemorrhage (aspirin).</li> </ul>			
	Diethylstilbestrol	Vaginal carcinoma of female offspring.	Benzodiazepines	Diazepam	- Chronic use → neonatal dependence & withdrawal Respiratory depression ↓ blood flow.		
ACE	Captopril	Renal damage, anuria and hypotension.	Morphine, I	Diazepam	Respiratory depression ↓ blood flow.		
inhibitors	Enalapril	Renai damage, andria and hypotension.	ACE inh	ibitors	Renal damage.		

#### Cont.: Teratogens & drugs of abuse in pregnancy

Drugs in pregnancy								
Drug	Probably safe	Contraindicated	Drugs of choice					
Hypertension	<ul> <li>α- methyldopa.</li> <li>Labetalol.</li> <li>Emergency:</li> <li>Hydralazine</li> <li>Labetalol</li> </ul>	<ul><li>ACE inhibitors.</li><li>Angiotensin II receptor blockers.</li><li>Thiazide diuretics.</li><li>Propranolol (not selective).</li><li>Ca channel blockers.</li></ul>	<ul><li>α-methyl dopa.</li><li>Labetalol.</li><li>Hydralazine</li></ul>					
Anticoagulants	- Heparin. - Antidote: <b>Protamine sulphate</b>	Warfarin: - 1 <sup>st</sup> trimester: Chondroplasia 2 <sup>nd</sup> and 3 <sup>rd</sup> : risk of bleeding.	Heparin.					
Antibiotics	<ul> <li>Penicillins: (ampicillin, amoxicillin).</li> <li>Cephalosporins.</li> <li>Erythromycin &amp; azithromycin (in case of penicillin-hypersensitivity).</li> </ul>	<ul> <li>Tetracyclines.</li> <li>Quinolones (ciprofloxacin): arthropathy.</li> <li>Aminoglycosides</li> <li>Sulfonamides.</li> <li>Chloramphenicol.</li> <li>Erythromycin estolate (risk of hepatic injury)</li> </ul>	<ul><li>Penicillin.</li><li>Cephalosporins.</li><li>Erythromycin</li></ul>					
Antithyroidism	Propylthiouracil (protein-bound)	<ul> <li>Methylthiouracil (Methimazole).</li> <li>Carbimazole.</li> <li>Radioactive Iodine (I<sup>131</sup>).</li> </ul>	Propylthiouracil (protein-bound)					
Antidiabetics	-	Antidiabetics	Insulin.					
NSAIDs	-	-	Acetaminophen.					
Anticonvulsants	-	Valproic acid (highly teratogenic)	Folic acid supplementation (prevents neural tube defects in women receiving AEDs).					

	Alcohols	Fetal Alcohol Syndrome (FAS): Microcephaly - Low weight birth - Craniofacial abnormalities - CNS and CVS abnormalities.
Drugs of Abuse in pregnancy	Cocaine	Inhibits reuptake of sympathomimetics, Hypoxia, Microcephaly, Retardation, Placental abruption.
pregnancy	Tobacco	No evidence it causes birth defects: Spontaneous abortion, Preterm labor, ↓ blood flow to placenta, hypoxia,  Retarded fetal growth, Low birth weight, Perinatal mortality.

Lecture 6: Hormonal replacement therapy

	Drugs	MOA	Indications	ADRs	Ot	her
Estrogen	Estradiol	Binds to its receptors:  ERα: mediates female hormonal functions Endometriu m, breast, ovaries  ER β: mediates other hormonal functions on other organs.	A- In menopause (Not given unless presence of symptoms).  - Hot flushes & night sweats.  - Sleep disturbance & mood swings.  - Urethral & urinary symptoms.	<ul> <li>Long term HRT increases</li> <li>CVS problems.</li> <li>Irregular vaginal</li> <li>bleeding.</li> <li>Vaginal discharge.</li> <li>Fluid retention, Weight</li> </ul>	<ul> <li>Never exceed 5 yrs administration.</li> <li>Alone after hysterectomy or with progestin as HRT.</li> <li>Oral: Conjugated equine, Estradiol valerate, Estrial succinate. (Oral bioavailability is low).</li> <li>Transdermal "estradiol" (Patches ,Gel).</li> <li>Subcutaneous "estradiol" (implant).</li> <li>Intra-Vaginal (cream or rings pessaries).</li> <li>Intramuscular (depot)</li> <li>Contraindications:</li> <li># Undiagnosed vaginal bleeding.</li> <li># Severe liver disease.</li> <li># Thromboembolic manifestations.</li> <li># Cancer: endometrial, breast (hormone sensitive), ovarian.</li> </ul>	
	Conjugated Estrogens		<ul> <li>Vaginal dryness.</li> <li>Increases bone density.</li> <li>Protects CVS (enhance vasodilatation via ↑ NO production, ↑ HDL &amp; ↓ LDL).</li> <li>Improves Insulin resistance.</li> </ul>	gain Breast tenderness Spotting or darkening of skin.  If given with:		
	Esterified estrogens		<ul> <li>Improves cognitive function</li> <li>Delays parkinsonism</li> <li>B- Contraception.</li> <li>C- Primary ovarian failure.</li> <li>D- Amenorrhea &amp; Hirsutism caused by excess androgens.</li> </ul>	<ul> <li>SERMs: additive side effects.</li> <li>Aromatase inhibitors: ↓ efficacy</li> <li>Corticosteroids: ↑ side effects</li> </ul>		
	Progesterone		Protects against breast cancer	- Mood changes, as anxiety, irritability.	Administration -Oral; Micronized progesterone or	Degraded in GIT, so can be given only parentally
Progestins	Progestins	Binds to its receptors PR-A & PR-B	<ul> <li>Protects against estrogen induced endometrial cancer.</li> <li>Confers neuroprotection.</li> <li>Controls insomnia &amp; depression.</li> <li>Counteract osteoporosis.</li> </ul>	<ul> <li>- Headache, dizziness or drowsiness.</li> <li>- Nausea, vomiting, abdominal pain or bloating (distention).</li> </ul>	progestins -IU; as Levonorgestrel or Progestasert	Not degraded by GIT
	Progestin preparations		<ul> <li>Contraception (Estradiol + Progestins).</li> <li>Dysmenorrhea.</li> <li>Menopausal symptoms (Estradiol + Progestins).</li> </ul>	- Hirsutism , masculinization (Not with new preparations)	-Vaginal - natural progesterone gel / pessaryTransdermal - sequential / continuous patch.	-

# **CONT...:** Hormonal replacement therapy

	Drugs	MOA	Indications	ADRs	Others
SERMs	Raloxifen	Antagonist in breast and uterus and <u>agonist in bone</u>	Preventing vertebral bone fracture and CVs problems less compared to Estrogen.	No effect on hot flushes.	Osteoporosis use of bisphosphonate is
	Tamoxifen	Antagonist in breast and partial <u>agonist in bone and</u> <u>endometrium</u> .		- Risk of venous thrombosis - Vaginal atrophy. - Hot flushes.	better than SERMs
	Isoflavones	- Mimic action of estrogen	- Alleviate symptoms related to menopause.	A	In soybeans, flaxseeds
Phytoestrogens	Lignans	on ER-b Block actions mediated by ER-a in some target tissues	- Possess CVS protective actions Lower risks of developing endometrial & breast cancer (ER-a).	Avoid in estrogen dependent breast cancer.	In whole grains
Androgens	Testosterone	Sexual arousal in females.	- Lack of sexual arousal Adjuvant to combined estrogen & progestin if all other menopausal symptom exist.		Not approved by FDA in women

Non-hormonal agents used in management of menopausal symptoms						
Fluoxetine (SSRI)	Fluoxetine (SSRI) Clonidine (centrally acting antihypertensive, alpha 2 agonist) Gabapentin (anti-convulsant)					
	Reduces severity and frequency of hot flushes.					

#### Lecture 7: Drugs affecting breast milk & lactation

Factors controlling passage of drugs into breast milk						
Factors related to <b>drugs</b>	Factors related to <b>Neonates</b>					
1. Molecular Weight: alcohol < Insulin < Heparin.  The epithelium of the breast alveolar cells is most permeable to drugs during the 1 <sup>st</sup> week	<ol> <li>Dose of the drug.</li> <li>Route of Administration: topical preparations carry less risk.(creams, nasal sprays or</li> </ol>	Amount of a drug Depends on	<ul><li>Amount of milk consumed.</li><li>Amount of drug absorbed from GI.</li><li>Ability of baby to eliminate drug.</li></ul>			
<ul> <li>postpartum</li> <li>Lipid Solubility of the drug "pass more freely.</li> <li>Degree of Ionization: Heparin pass poorly.</li> <li>PH Of Drug: Weak basic drugs concentrate in</li> </ul>	<ul><li>inhalers)</li><li>3. Time of Breastfeeding: mother should take medication just after nursing and 3-4 hours</li></ul>	Factors	<ul><li>Age.</li><li>Body weight.</li><li>Health status</li></ul>			
breast milk. Weak acidic drugs concentrated in plasma  5. Weak Acidic Drugs: concentrate in plasma.  6. Plasma Protein Binding of drugs: Only unbound form gets into maternal milk (Warfarin).  7. Half life of the drug:    Oxazepam (short) vs diazepam (long)  8. Volume of Distribution:    Large VOD = low transfer to milk.	before the next feeding.  4. Health Status: Breastfeeding is contraindicated in:  • HIV-positive.  • Active, untreated TB.  • Herpes on breast.  • Use of illegal drugs.  • Certain medications used chronically.  5. Maternal Drug Concentration	special cautions	<ul> <li>Premature infants.</li> <li>Low birth weight.</li> <li>Infants with G6PD deficiency.</li> <li>Infants with impaired ability to metabolize/excrete drugs: <ul> <li>eg. hyperbilirubinemia.</li> </ul> </li> </ul>			

Neonatal hyperbilirubinemia	Neonatal Methemoglobinemia	
Premature infants or infants with inherited G6PD deficiency: oxidizing drugs (Antibiotics: sulfonamides, trimethoprim, Antimalarials: Primaquine)  → hemolysis of RBCS → bilirubin (hyperbilirubinemia) → Kernicterus.	Infants<6m are prone to develop methemoglobinemia upon exposure to some oxidizing drugs. <b>Methemoglobin:</b> oxidized Hb that has ↓ affinity for O2 → hypoxia.	

Drugs contraindicated during lactation	<ol> <li>Anti-cancer: Doxorubicin, cyclophosphamide, methotrexate.</li> <li>Radiopharmaceuticals: radioactive iodine.</li> <li>CNS acting drugs: amphetamine, heroin, cocaine.</li> <li>Others: Lithium, Chloramphenicol, Atenolol, Potassium iodide.</li> </ol>
Drugs that can suppress lactation (↓ prolactin)	Levodopa (dopamine precursor), Bromocriptine (dopamine agonist). Estrogen (oral contraceptives), Androgens, Thiazide diuretics.
Drugs that can augment lactation (Dopamine antagonists: stimulate prolactin → galactorrhea)	Metoclopramide (antiemetic), Domperidone (antiemetic), Haloperidol (antipsychotic).  Methyl dopa (antihypertensive drug), Theophylline (used in asthma).

# Cont.: Drugs affecting breast milk & lactation

Using drugs during lactation						
Class	✓	compatible	X			
Antibiotics	<ul> <li>Penicillins:         <ul> <li>Ampicillin, amoxicillin</li> </ul> </li> <li>Cephalosporins</li> <li>Macrolides:         <ul> <li>erythromycin, clarithromycin</li> </ul> </li> </ul>	-	Quinolones, Chloramphenicol, Tetracyclines, Sulfonamides (co-trimoxazole)			
Sedative/ hypnotics	-	<ul> <li>Benzodiazepines: Diazepam, Lorazepam (<u>only single dose</u>).</li> <li>Barbiturates (phenobarbitone) (<u>NO prolonged use</u>).</li> </ul>	-			
Antidiabetics	Insulin	Oral antidiabetics	Metformin (lactic Acidosis)			
Analgesics	Acetaminophen (paracetamol)	lbuprofen	Aspirin (Reye's syndrome)			
Antithyroid	Propylthiouracil	-	Carbimazole, Methimazole, potassium iodide			
Anticoagulants	Heparin	Warfarin (monitor infant's prothrombin time during treatment).	-			
Antidepressants (SSRI)	Paroxetine	-	-			
CVS drugs	-	-	Atenolol			
Anticonvulsants	Carbamazepine, phenytoin	Valproic acid (Infants must be monitored for CNS Depression).	Lamotrigine			
Oral contraceptive	<ul><li>Progestin only pills or minipills.</li><li>Non hormonal method.</li></ul>	-	Estrogens containing pills			
Antiasthmatics	Inhaled corticosteroids - prednisone	-	-			
Other	-	-	Cytotoxic drugs, lodine (radioactive), Lithium			

#### Lecture 8: Drugs treating gonorrhoea & syphilis

Syphilis							
Class	Drugs	Туре	MOA	Pharmacokinetic	Adverse effects	Note	
Penicillins	Penicillin G Procaine penicillin G	e G	Inhibits bacterial cell wall synthesis	<ul> <li>Acid unstable.</li> <li>Penicillinase sensitive.</li> <li>Not metabolized.</li> <li>Excreted in urine through acid tubular secretion.</li> <li>Renal failure prolonged the duration of action.</li> </ul>	<ul><li>Hypersensitivity.</li><li>Convulsions.</li><li>Super infections.</li></ul>	- Narrow spectrum Active against: O Gram +ve. O Gram -ve cocci. O Non B-lactamase producing anaerobes B-lactamase sensitive	
Ist Choice  If Allergic to it use the others	penicillin G	A C T E	through inhibition of transpeptidase enzyme required for crosslinks.				
3rd Generation	Ceftriaxone	I D A L	Inhibit bacterial		<ul> <li>Hypersensitivity reactions.</li> <li>Thrombophlebitis.</li> <li>Superinfections.</li> <li>Diarrhea.</li> </ul>	<ul><li>Given parenterally</li><li>Eliminated via biliary excretion</li><li>Long Half-life</li></ul>	
Cephalosporins	Cefixime		cell wall synthesis.	-		<ul><li>Given orally.</li><li>More effective against gram -ve.</li><li>Excreted in urine.</li></ul>	
Tetracyclines	Doxycycline	B A C T E R I O S	Inhibit bacterial protein synthesis by reversibly binding to 30S bacterial ribosomal subunits.	<ul><li>Given orally</li><li>Well absorbed orally</li><li>Long acting</li><li>Twice daily for 14 days.</li></ul>	<ul> <li>Nausea, vomiting ,diarrhea, Vertigo &amp; epigastric pain.</li> <li>Brown discoloration of teeth in children.</li> <li>Deformity or growth inhibition of bones in children.</li> <li>Hepatic toxicity (prolonged therapy with high dose).</li> <li>Superinfections.</li> </ul>	<ul> <li>Not effective for treatment of gonorrhea.</li> <li>Contraindication:  O Pregnancy.  O Breast feeding.  O Children (below 10 yrs).</li> </ul>	
Macrolides	Azithromycin	A T I c	Inhibits bacterial protein synthesis by binding to bacterial 50S ribosomal subunits.	<ul> <li>Acid stable.</li> <li>Don't penetrate CSF.</li> <li>Half life: 2-4 days.</li> <li>Once daily,oral dose.</li> <li>Given 1- 2 h after meals.</li> <li>No effect on cyt P450.</li> </ul>	<ul> <li>GIT upset: Nausea,</li> <li>vomiting, abdominal pain</li> <li>&amp; diarrhea.</li> <li>Allergic reactions:</li> <li>urticaria, mild skin rashes.</li> </ul>	-	

# Cont.: Drugs treating gonorrhoea & syphilis

Gonorrhea							
Class	Drugs	MOA	PK	Adverse effects	Note		
3rd Generation Cephalosporins 1st Choice	Ceftriaxone Cefixime	-	500mg ceftriaxone,I.M or 400 mg of cefixime, po	-	<ul> <li>Typically given with a single dose of         <ul> <li>Azithromycin(1gm, po)</li> <li>or</li> <li>Doxycycline(100 mg BD, po)</li> </ul> </li> </ul>		
Fluoroquinolone 2nd Choice	Ciprofloxacin Ofloxacin	All are bactericidal Inhibit DNA synthesis by inhibiting DNA gyrase enzyme (required for DNA supercoiling).	Single oral.	<ul> <li>GIT: NVD.</li> <li>CNS: Headache &amp; dizziness.</li> <li>May damage growing cartilage and cause arthropathy.</li> <li>Phototoxicity, avoid excessive sunlight.</li> </ul>	CONTRAINDICATIONS - Pregnancy Nursing mothers Children under 18 years.		
Spectinomycin	-	Inhibits protein synthesis by binding to 30 S ribosomal subunits.	Is given 2 g, i.m, once.	<ul><li>Pain at site of injection.</li><li>Fever.</li><li>Nephrotoxicity (not common).</li></ul>	-		
Silver nitrate	-	It has germicidal effects due to precipitation of bacterial proteins by liberated silver ions.	Put into conjunctival sac once immediately after birth (no later	-	<ul> <li>Treatment of Complicated infections With conjunctivitis</li> <li>O Corneal (Erythromycin)</li> </ul>		
Erythromycin	-	-	than 1 h after birth).		in New born.		

# Lecture 9: Drugs used in male infertility

Category	Drug	MOA	Indications	Kinetics	ADRs	Note
Testosterone	-		-	<ul> <li>Ineffective orally.</li> <li>I.M or S.C.</li> <li>Inactivated in the liver.</li> <li>Disadvantages: Short duration of action.</li> </ul>	- Excess androgens (> 6 wks) → impotence, ↓ spermatogenesis & gynecomastia ↓ HDL & ↑ LDL → ↑ risk CHD Edema Hepatic dysfunction Hepatic carcinoma (long term use) - Behavioral changes: aggressiveness Polycythemia → ↑ risk of clotting Premature closing of epiphysis ↓ Testicular size.	Testosterone 1\Contraindication: - Male patients with cancer of breast or prostate Severe renal & cardiac disease Psychiatric disorders Hypercoagulable states Polycythemia.  2\Interaction: + corticosteroids → oedema + warfarin → ↑ bleeding + insulin or oral hypoglycemics     → hypoglycemia + propranolol → ↓ propranolol efficacy
Synthetic Androgens	-	- Virilizing (eg. spermatogenesis).	-	-		
Dowing d from	Proprionate	- Anabolic effects	- Androgen deficiency in adult male infertility Delayed puberty with hypogonadism (give androgen slow & spaced)	- Oil for IM; every 2-3 weeks - Long duration of action		
Derived from Testosterone	Enanthate	(eg. ↑bone density).				
(ester)	Cypionate					
Derived from	Fluoxymesterone			- Orally; daily. - Long duration of action.		
Testosterone (Other)	Methyltestosterone					
(Other)	Danazol					
Derived from DHT	<u>Mesterolone</u>	Not aromatized into estrogens → no -ve of GnHs → encourages natural testosterone production spermatogenesis is enhanced.	<ul><li> ↓ Testosterone.</li><li> 2ndry hypogonadism.</li></ul>	- Orally; daily. - Long duration of action.	-	Not hepatotoxic.
Antiestrogens	Clomifen	- ↑ GnRH & improve its pituitary			Dad towns on in man	
SERMs	Tamoxifen	response. - Induce libido.	-	-	Bad temper in men	
Antiestrogens Aromatase inhibitors	Anastrazole	<ul> <li>↑ GnRH &amp; improve its response.</li> <li>Blocks conversion of testosterone to estrogen within the hypothalamus.</li> <li>Inducing spermatogenesis.</li> </ul>	Best to improve sperm count & motility with good pregnancy rates.	Given as daily dose over a period of 1-6 months.	-	

# Cont.: Drugs used in male infertility

Category	Drug	MOA	Indications	Kinetics	ADRs
GnRH	-	Androgenization & spermatogenesis.	hypothalamic dysfunction.	Given as Pulsatile GnRH therapy using a portable pump.	<ul> <li>- Exogenous excess → ↓ LH responsiveness.</li> <li>- Depression, generalized weakness, pain.</li> <li>- Gynecomastia.</li> <li>- Osteoporosis.</li> </ul>
GnHs	-	- Spermatogenesis  2ndry hypogonadism  GnHs replacement must be combined: + hCG (IM.2 ms.) followed by hCG + hMG (IM. 6 -12 ms).		<ul><li>- Local swelling (injection site).</li><li>- Flushing,/</li><li>- Gynecomastia.</li><li>- Precocious puberty.</li></ul>	
	Antioxidants	Protect sperm from oxidative damage (e.g. vit E,C).	-	-	-
	Kallikrein	Proteolytic activity, cleaving kininogen to kinins → important for sperm motility.	-	-	-
Non- hormonal therapy	Folic acid	RNA and DNA synthesis during spermatogenesis & has antioxidant properties.	-	-	-
*	Zinc Supplements	Testicular development, sperm production & sperm motility.	-	-	-
	L-Carnitine	important for Sperm maturation.	-	-	-
