

LYMPHOPROLIFERATIVE DISORDERS

Dr. Mansour Aljabry

Definition

Lymphoproliferative disorders

Several clinical conditions in which lymphocytes are produced in excessive quantities (Lymphocytosis)

Lymphoma

Malignant lymphoid mass involving the lymphoid tissues (\pm other tissues e.g : skin ,GIT ,CNS ...)

Lymphoid leukemia

Malignant proliferation of lymphoid cells in Bone marrow and peripheral blood (\pm other tissues e.g : lymph nods ,spleen , skin ,GIT ,CNS ...)

Lymphoproliferative disorders

Autoimmune

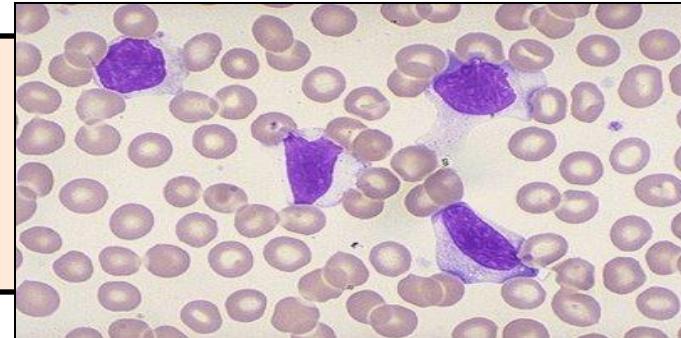

Infection

Malignant

Lymphocytosis

1- Viral infection :

- Infectious mononucleosis ,cytomegalovirus ,rubella, hepatitis, adenoviruses, varicella....

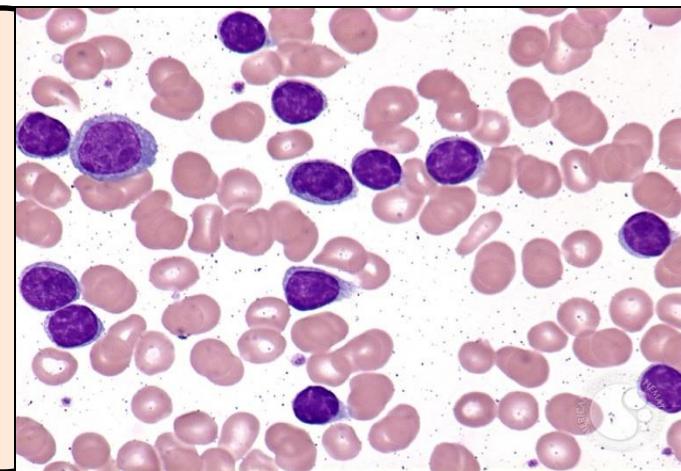

2- Some bacterial infection:

(Pertussis ,brucellosis ...)

3-Immune : SLE , Allergic drug reactions

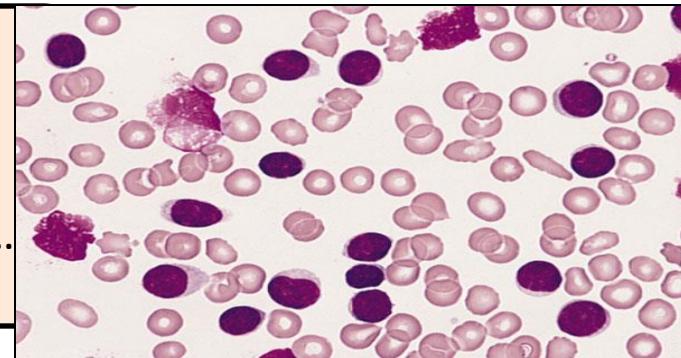

4- Other conditions:, splenectomy, dermatitis ,hyperthyroidism metastatic carcinoma....)

5- Chronic lymphocytic leukemia (CLL)

6-Other lymphomas:

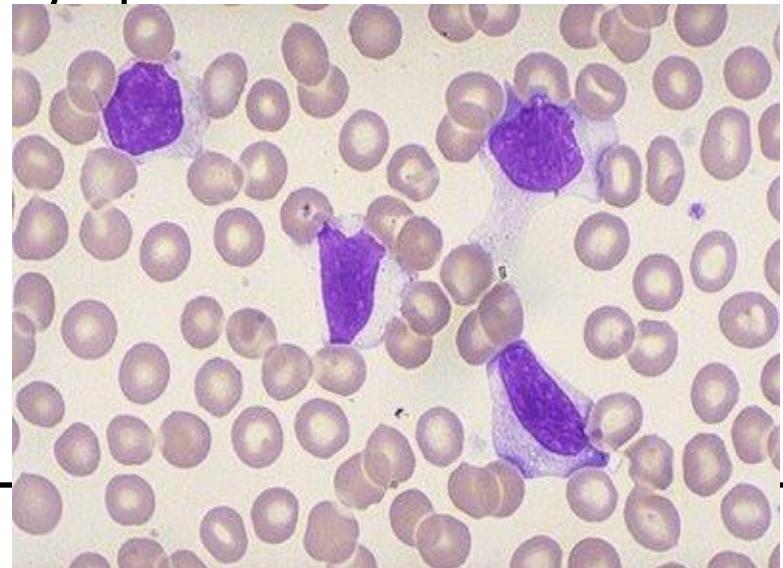

Mantle cell lymphoma ,Hodgkin lymphoma...

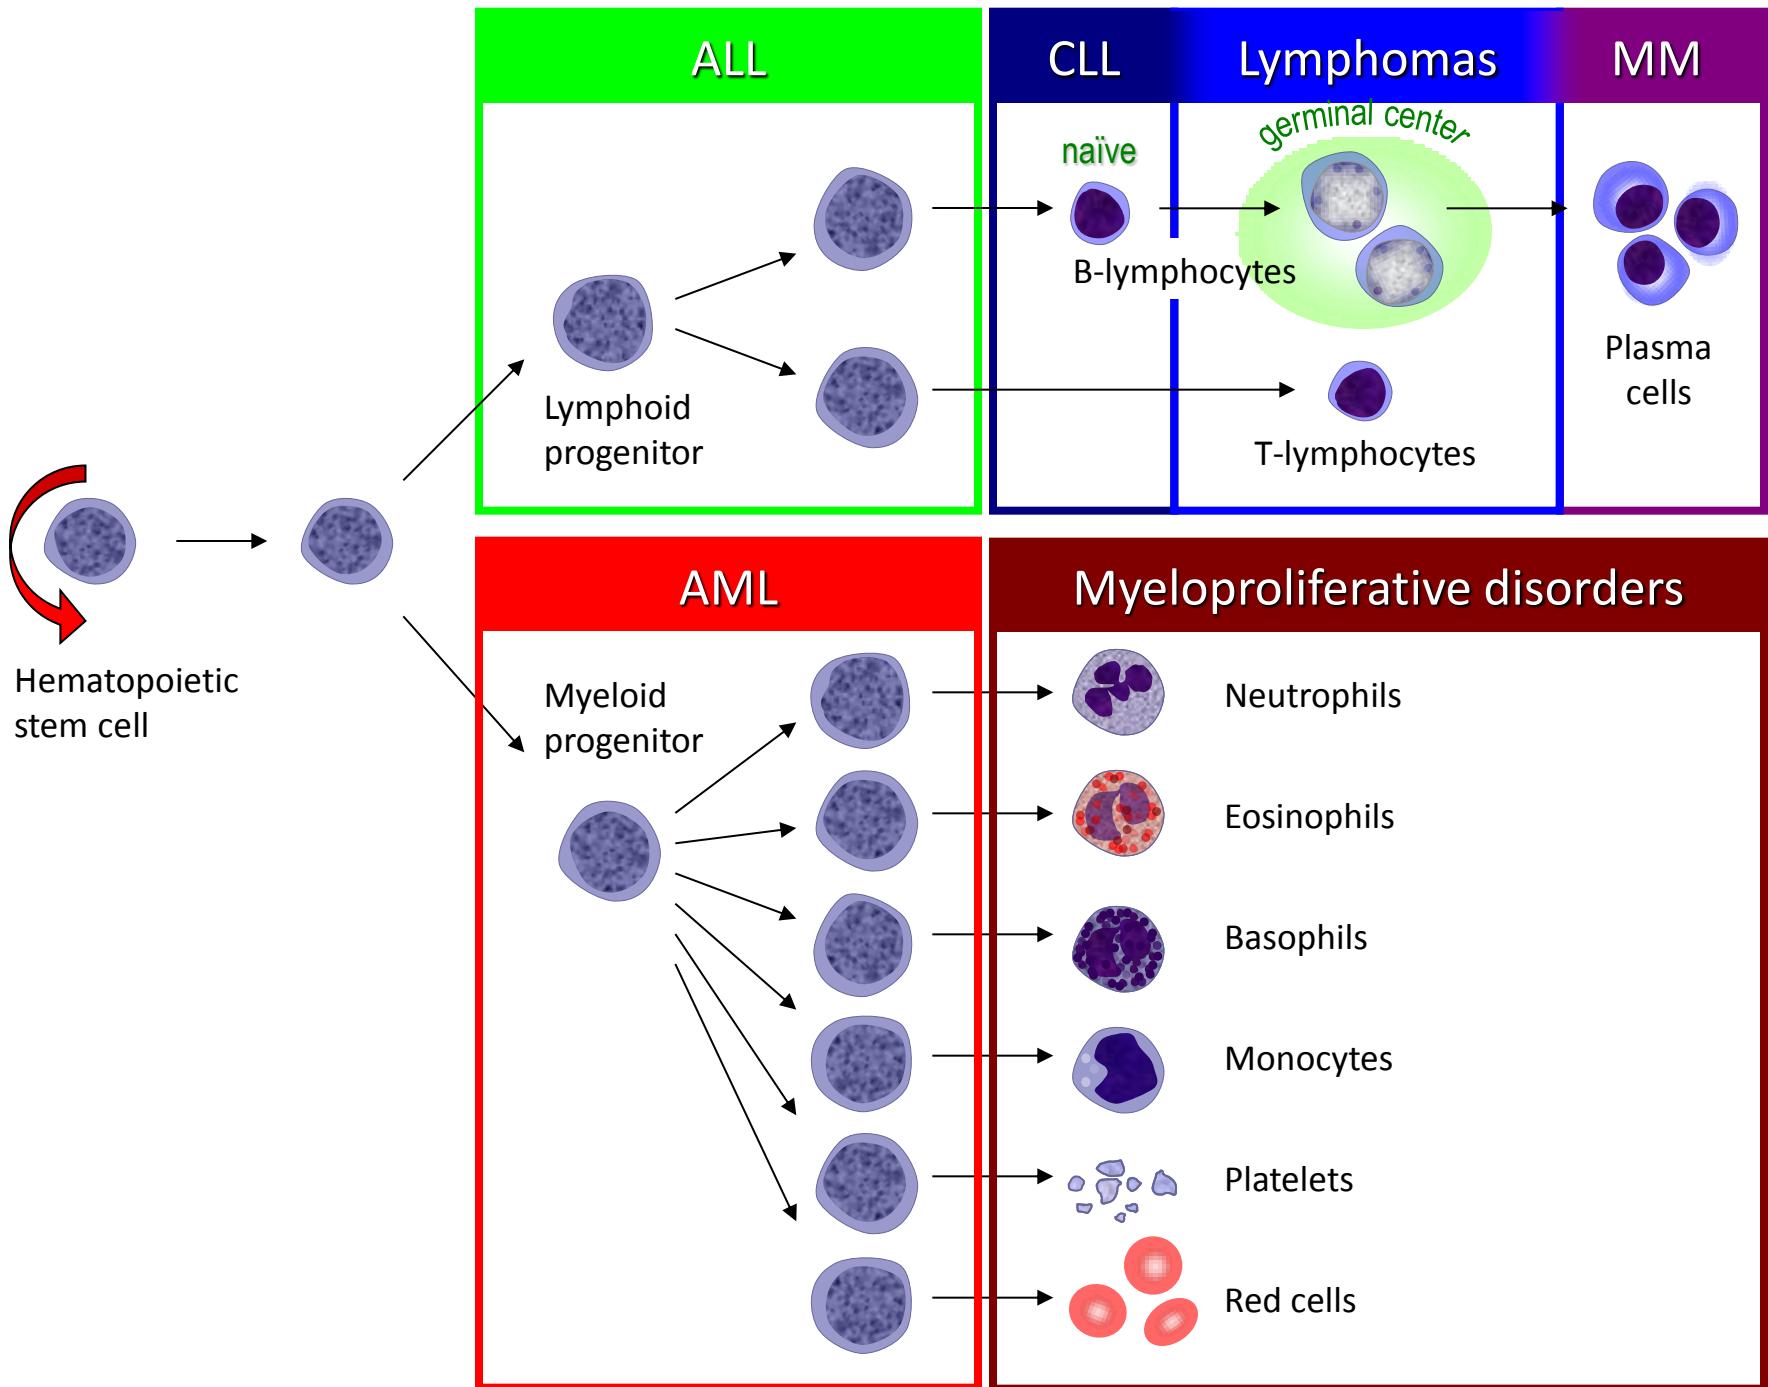

Infectious mononucleosis

An acute, infectious disease, caused by Epstein-Barr virus and characterized by

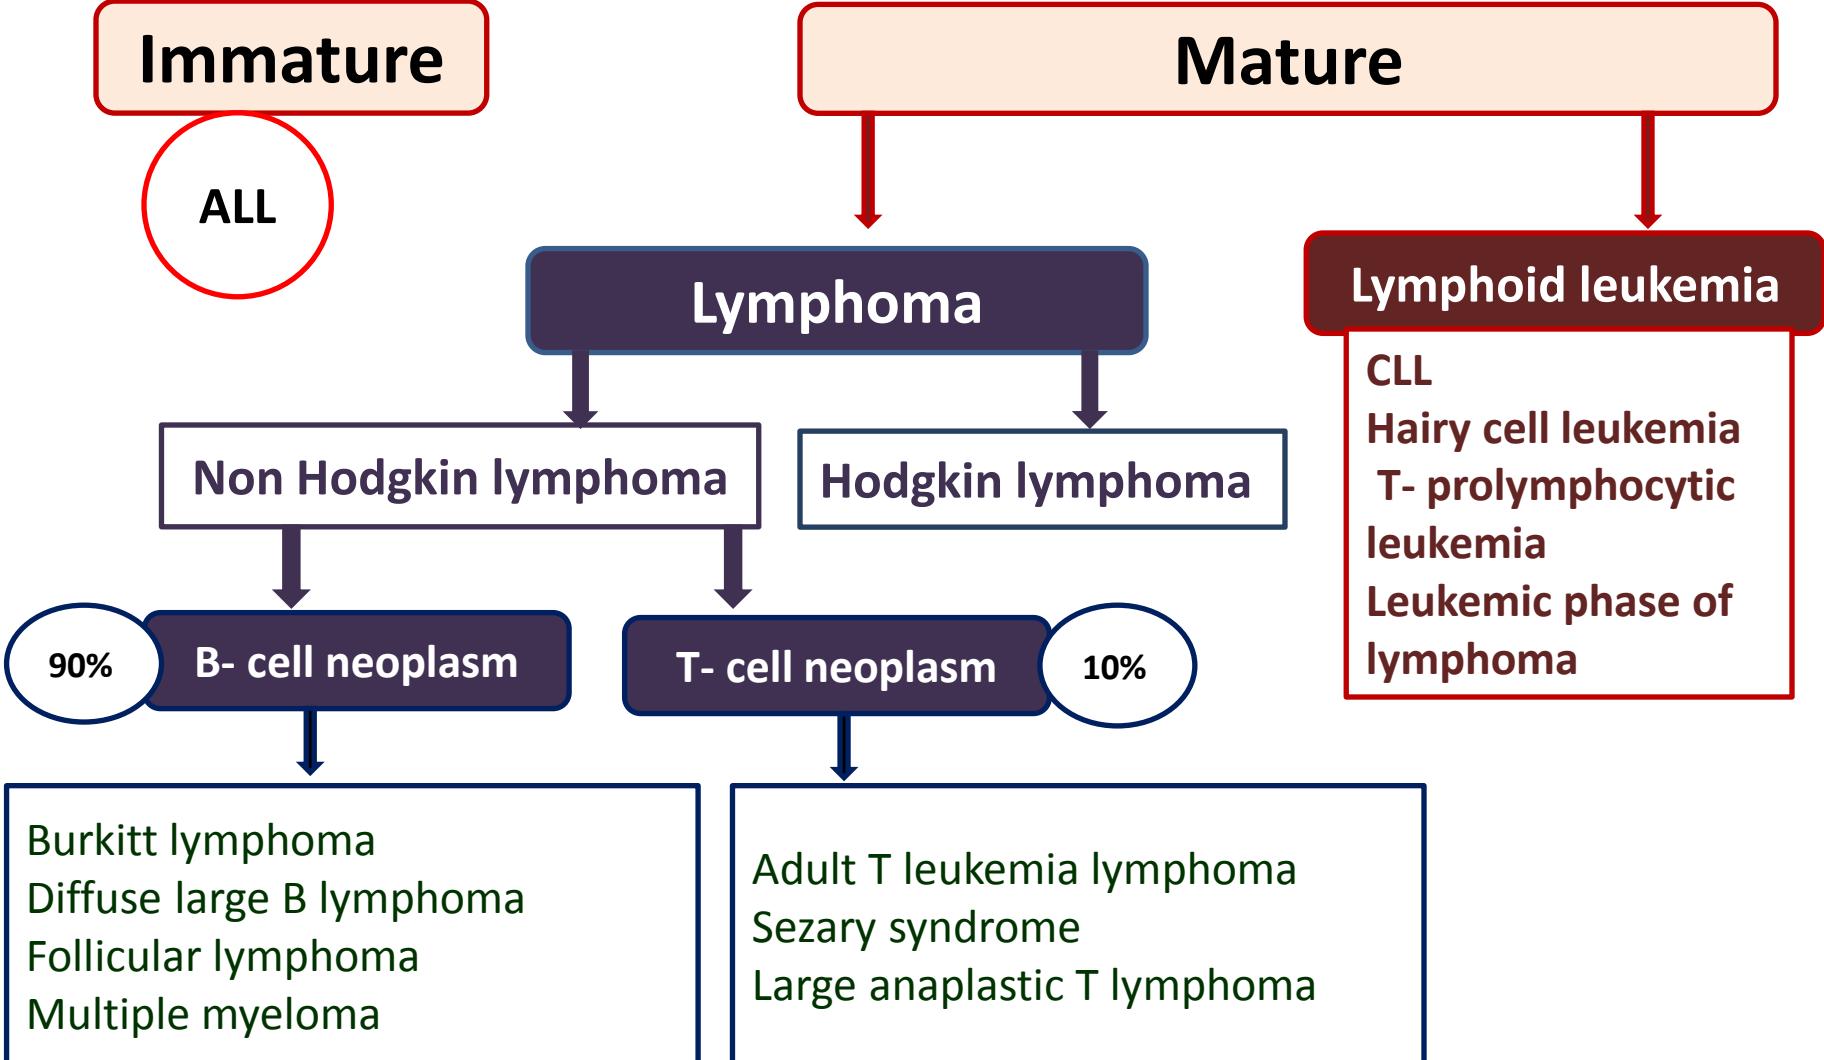

- fever
- swollen lymph nodes (painful)
- Sore throat,
- atypical lymphocyte
- Affect young people (usually)

Malignant Lymphoproliferative Disorders

CD 5

CD10

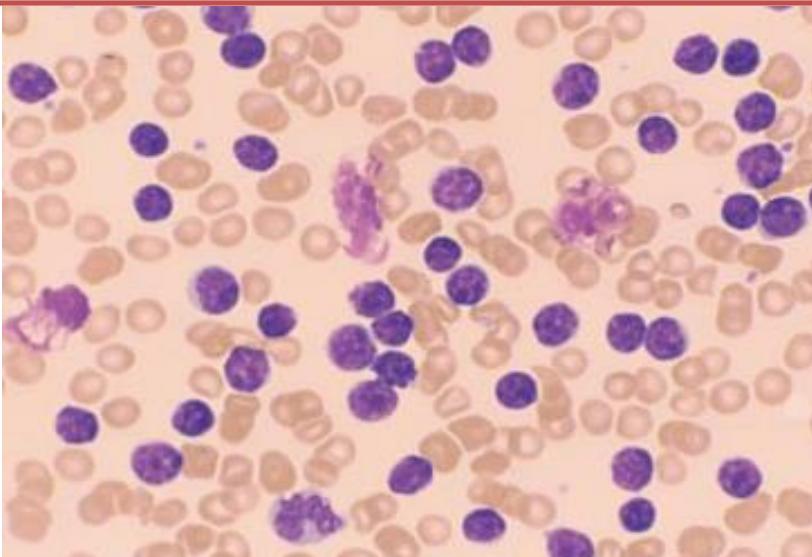

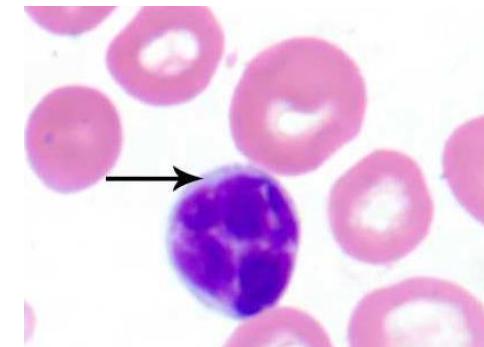

Chronic Lymphocytic Leukemia

- **Malignant neoplasim characterized by an increased number of small, mature lymphocytes in the blood (>5,000) and bone marrow (\pm spleen and lymph node)**
- **The most common adult leukemia (~25% of adult leukemias)**
- **The median age is ~55 to 65 years. (rare < 40 years).**
- **1.5 to 2 times more common in men than women.**

Features of CLL

- 40% of patients are asymptomatic at diagnosis.
- Moderate lymphadenopathy and splenomegaly
- Lymphocytosis (>5,000):
 - Small mature-appearing lymphocytes
 - Condensed (“soccer ball”) nuclear chromatin
 - Numerous “smudge cells”
- Predisposition to infection
- Autoimmune phenomena (autoimmune hemolytic anemia)
- Transformation to large cell lymphoma (Richter’s syndrome)

CLL Staging

Rai Staging	Prognosis
Stage 0: Lymphocytosis only (blood and marrow)	Low risk
Stage I: Lymphocytosis plus enlarged nodes	Watch &wait
Stage II: Lymphocytosis plus enlarged spleen and/or liver, ± nodes	Intermediate ± chemo
Stage III: Lymphocytosis plus anemia (Hgb <11 g/dL), ± above	
Stage IV: Lymphocytosis plus thrombocytopenia ($<100 \times 10^9/L$) ± above	High risk FCR

Burkitt's lymphoma

High-grade non-Hodgkin's B-cell lymphoma which is rapidly growing and highly aggressive with extremely short doubling time (24 hrs)

Types of Burkitt's lymphoma

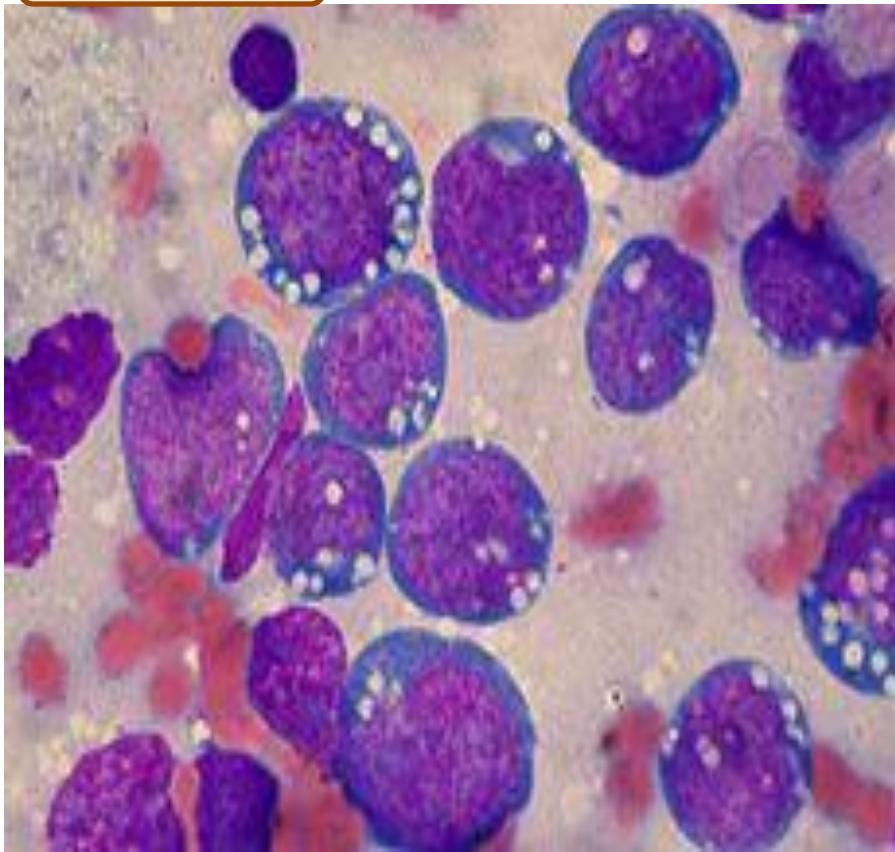

1-Endemic: associated with chronic malaria and EBV In equatorial Africa . It particularly affects the jaw, other facial bone and breast.

Sporadic: occurs throughout the world and affects GIT.

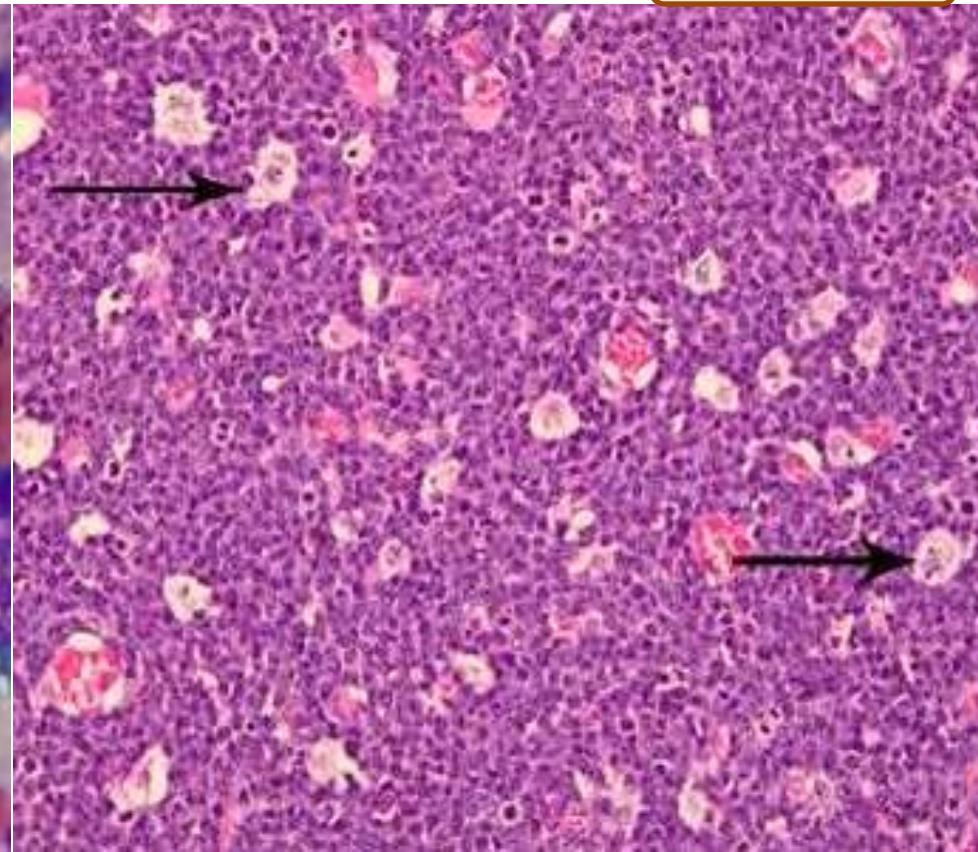

Immunodeficiency-associated: associated with HIV infection or the use of immunosuppressive drugs

Morphology

BMA

Biopsy

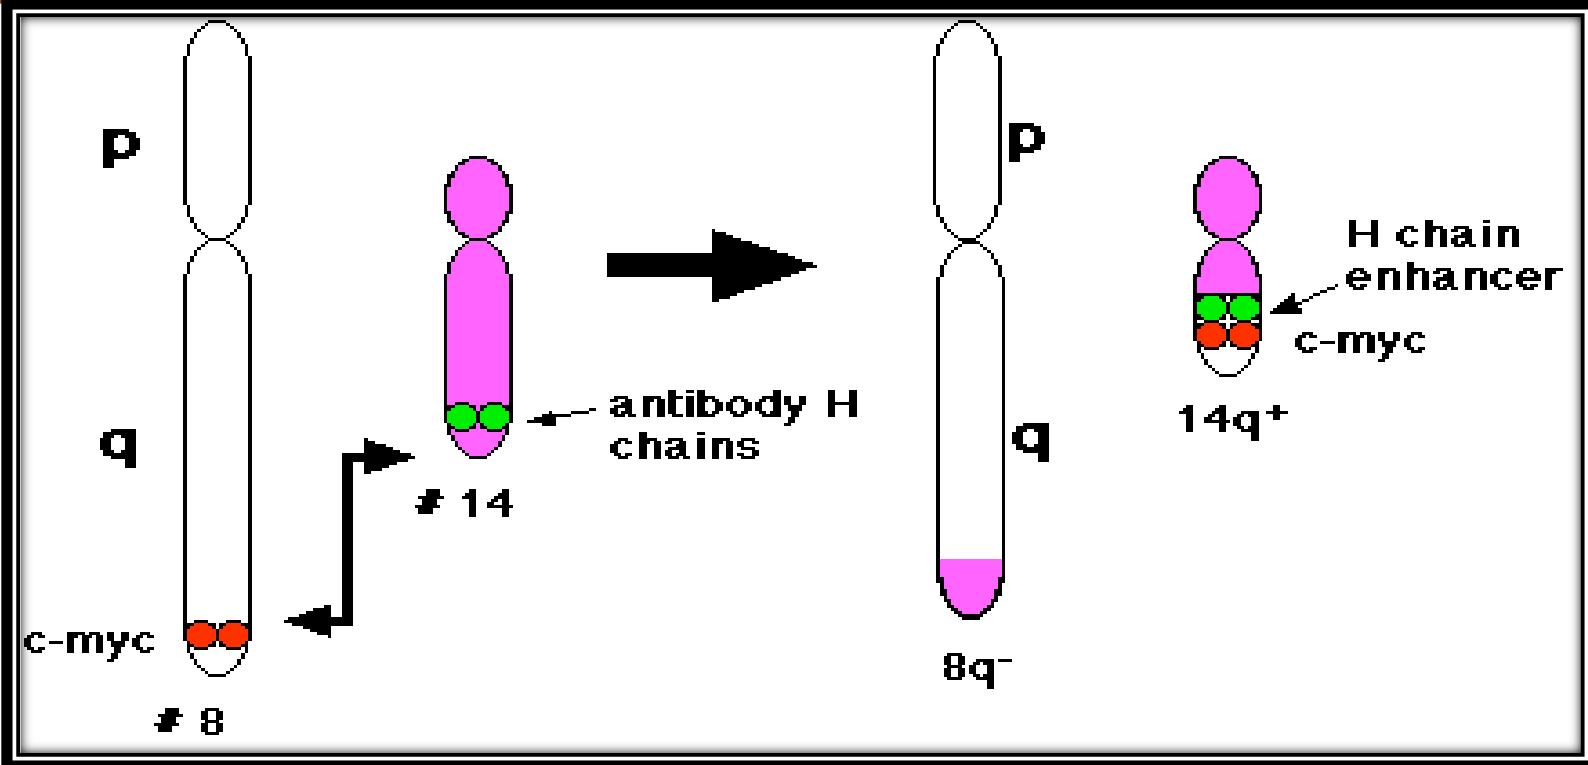

Homogenous medium size cells with round nuclei and deeply basophilic and vacuolated cytoplasm

Diffuse infiltration with "starry sky" (Macrophages engulfing the apoptotic cells)

Genetics of BL

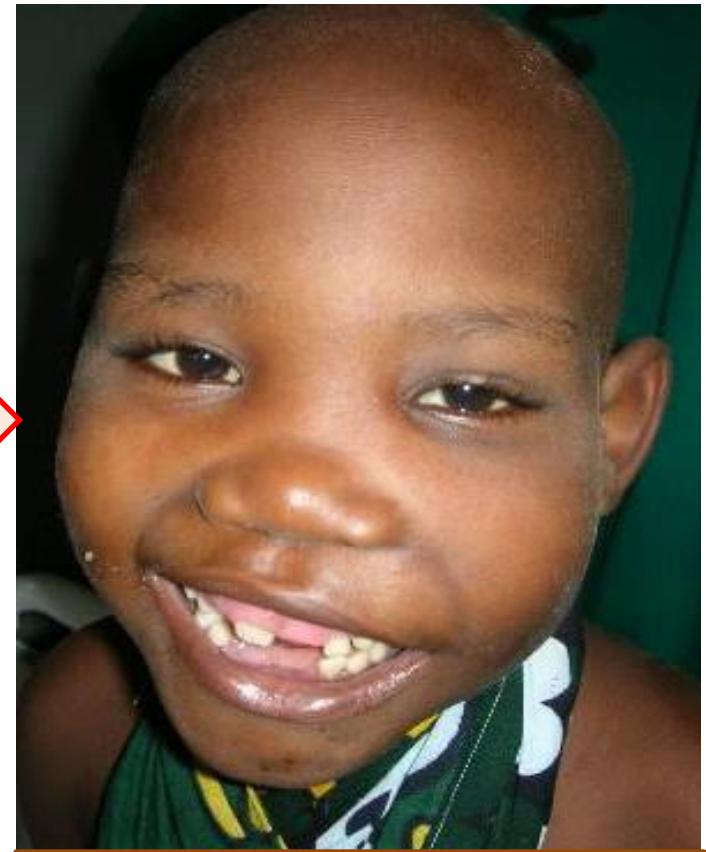

- Highly associated with t(8;14):
Translocation of the c-MYC proto-oncogene at chromosome 8
to immunoglobulin gene at chromosome 14
- The c-MYC is nuclear transcription factor .
- Burkitt's lymphoma is the fastest growing tumor in humans.

Clinical Presentation

After 25 D
of intensive
chemotherapy

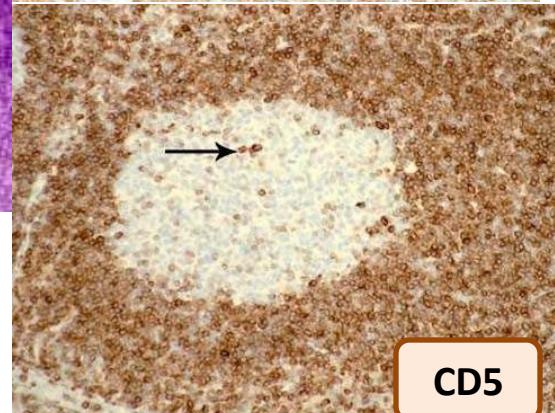

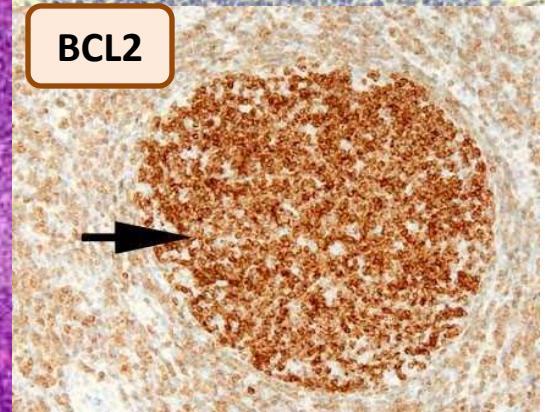

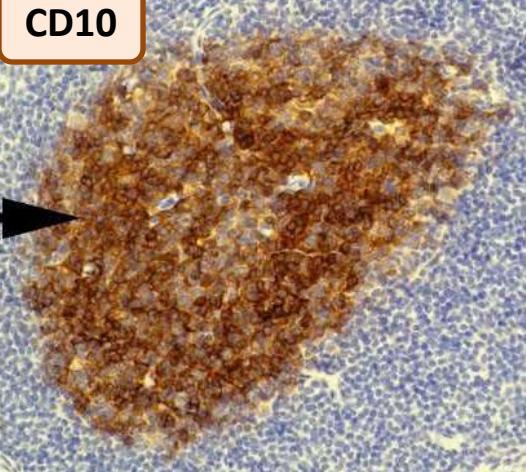

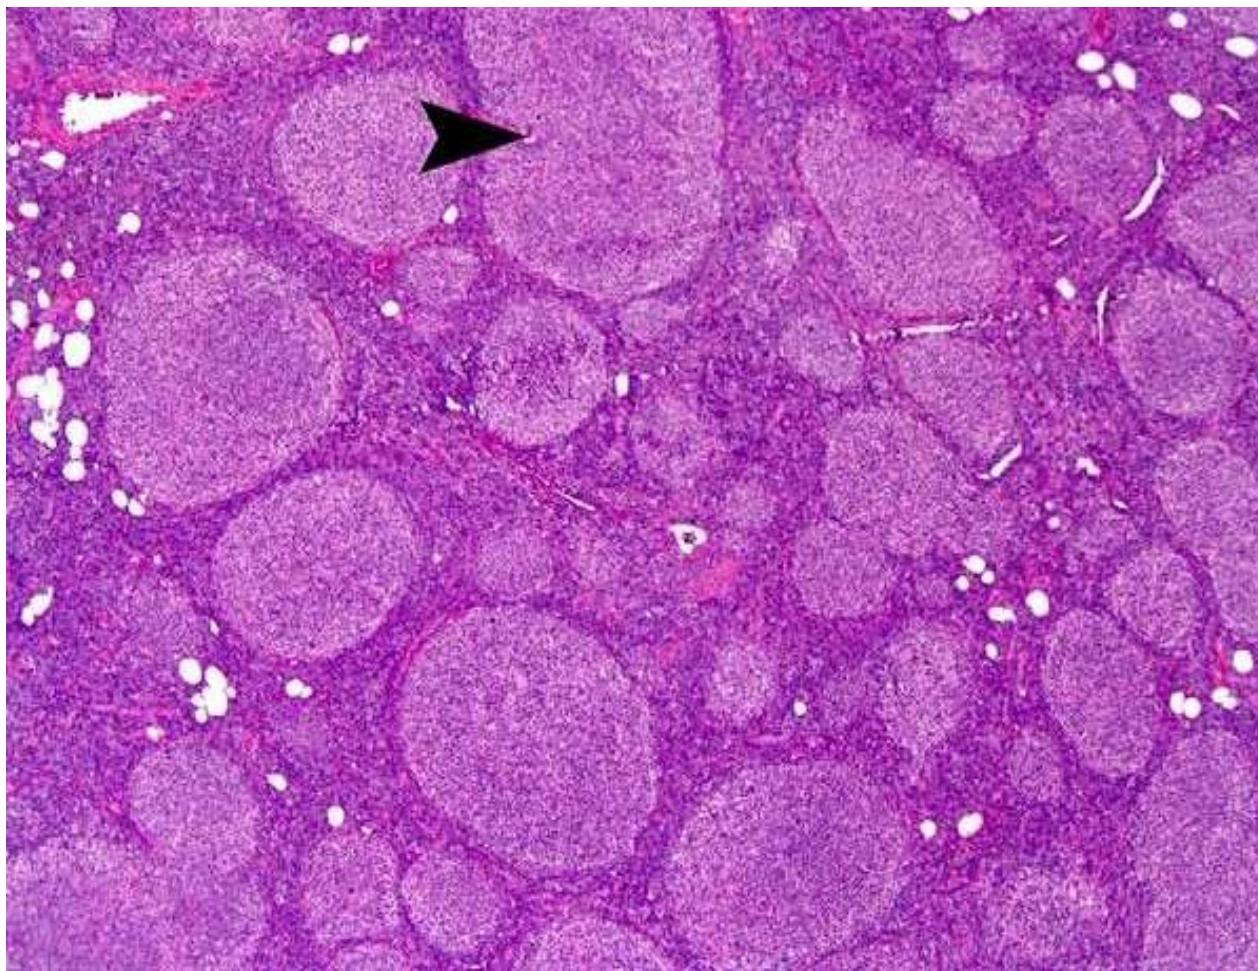

Cure rate:

- 90% at early phase
- 70% at advance disease

Follicular lymphoma

- FL is malignant proliferation of germinal center B cells centrocyte which has at least a partially follicular pattern.
- Due to overexpression o f Bcl2 caused by t(14;18) .
- Most common type of “indolent” lymphoma (25%).
- Presented as:
- Lymphadenopathy (100%)
- splenomegaly (80%)
- BM involvement (60%)
- blood involvement (40%).
- Indolent but incurable (some exceptions)

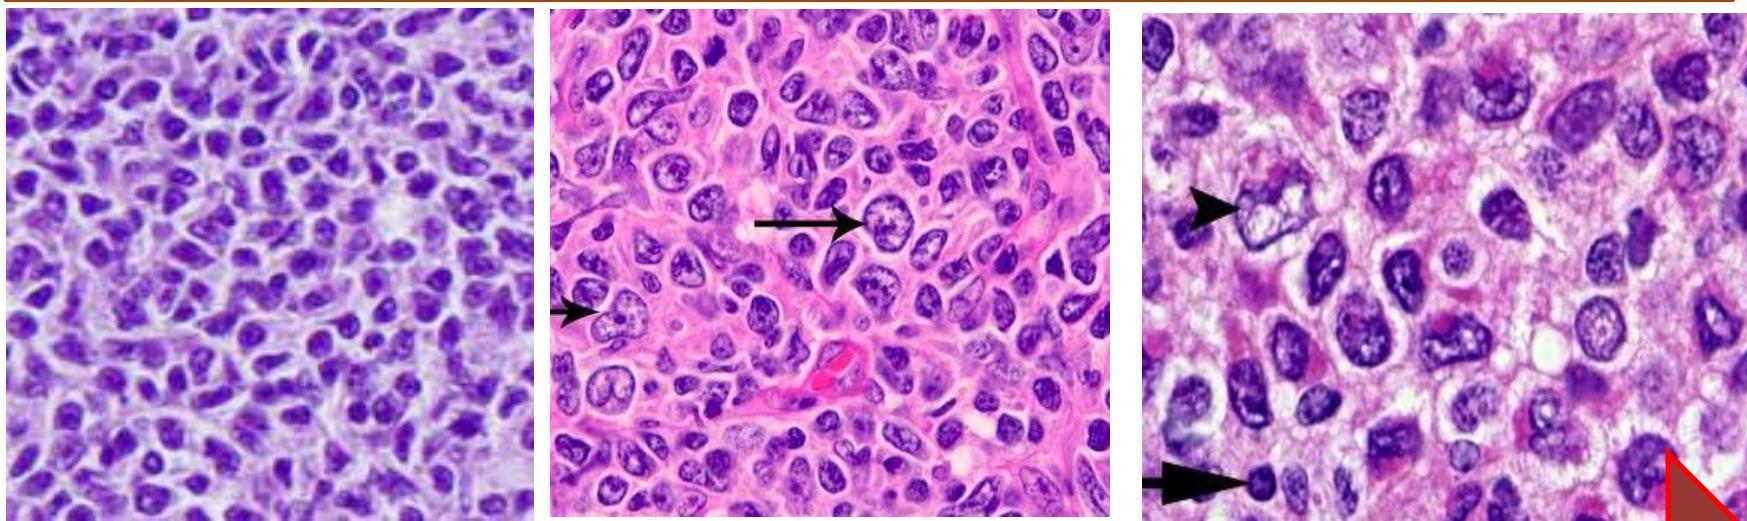

Diagnosis

Immunophenotyping:
Positive for CD10, CD20 and Bcl2
Negative for CD5 (in most cases)

Management

- Median survival is around 10 years.
- Transformation to aggressive lymphoma (DLBCL) can occur.

Low grade FL

FL in transformation

Aggressive transformation (DLBCL)

Watch and weight
(most often)

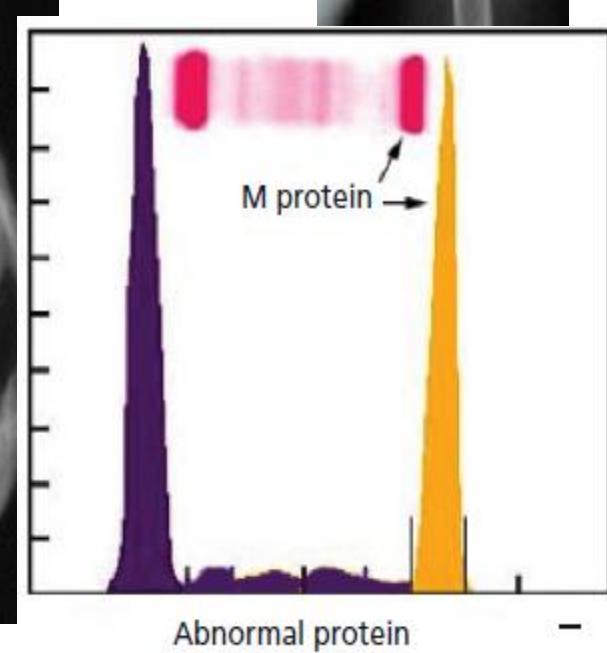

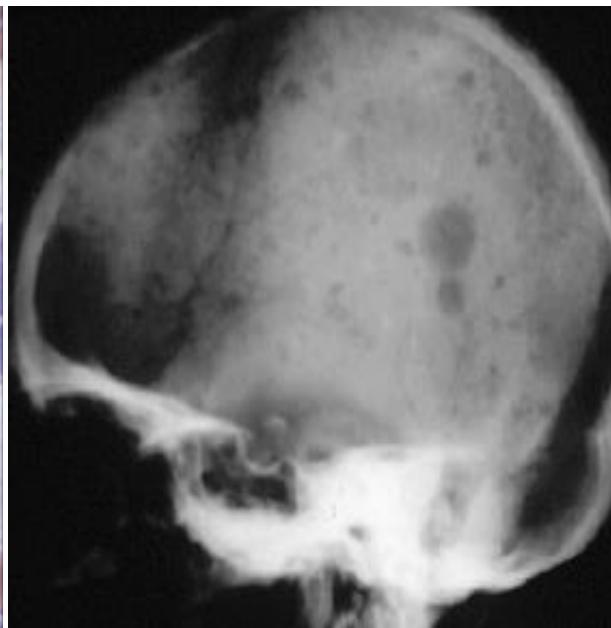

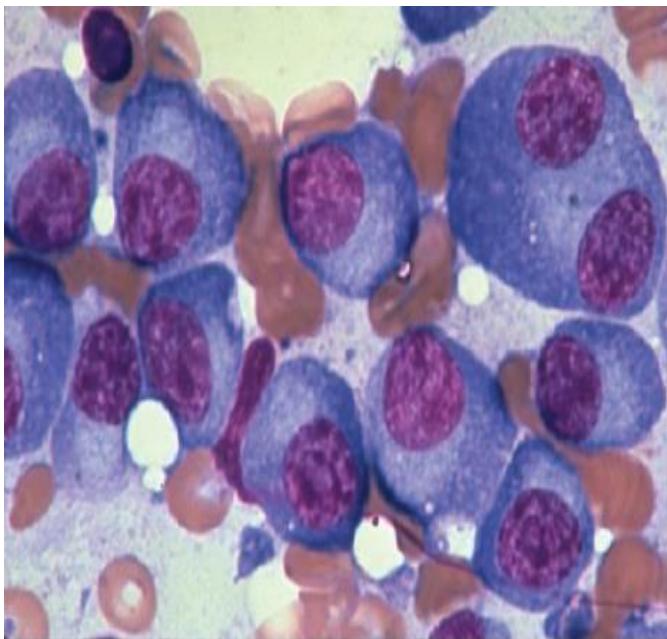

Chemotherapy

Aggressive Chemotherapy(± SCT)

Multiple Myeloma

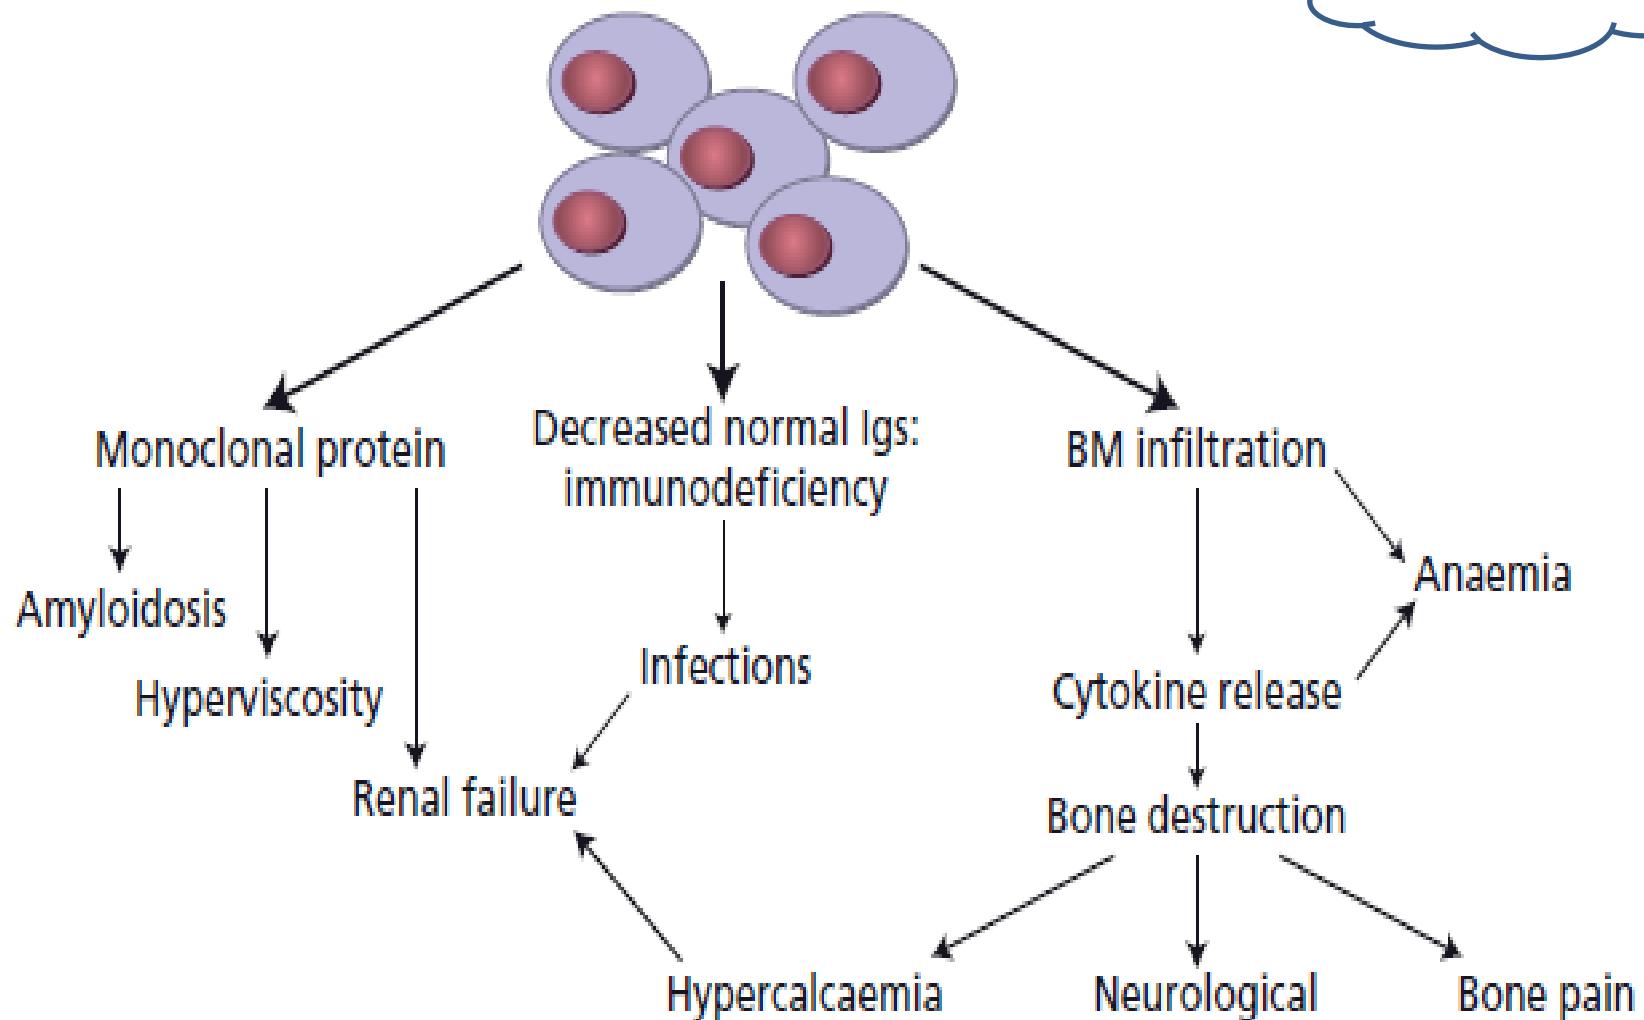

Malignant B neoplasm characterized by a triad of abnormalities:

- Accumulation of plasma cells in the bone marrow
- Lytic Bone lesions
- Production of a monoclonal immunoglobulin (Ig) or Ig fragments

Pathogenesis of MM

Hodgkin lymphoma

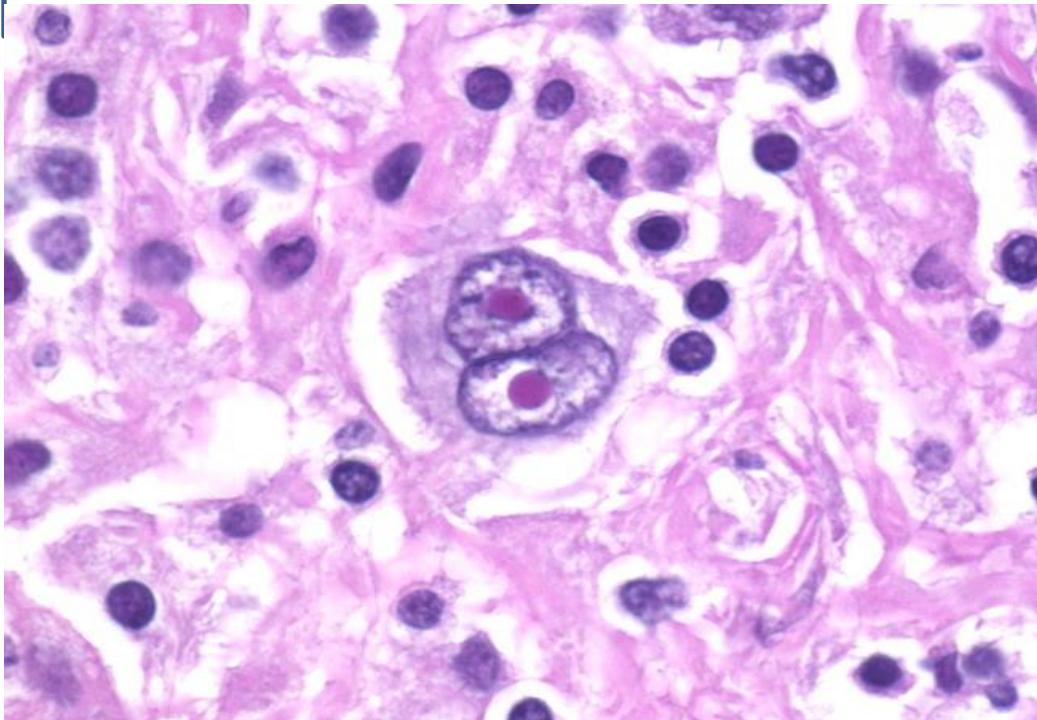

Thomas Hodgkin
(1798-1866)

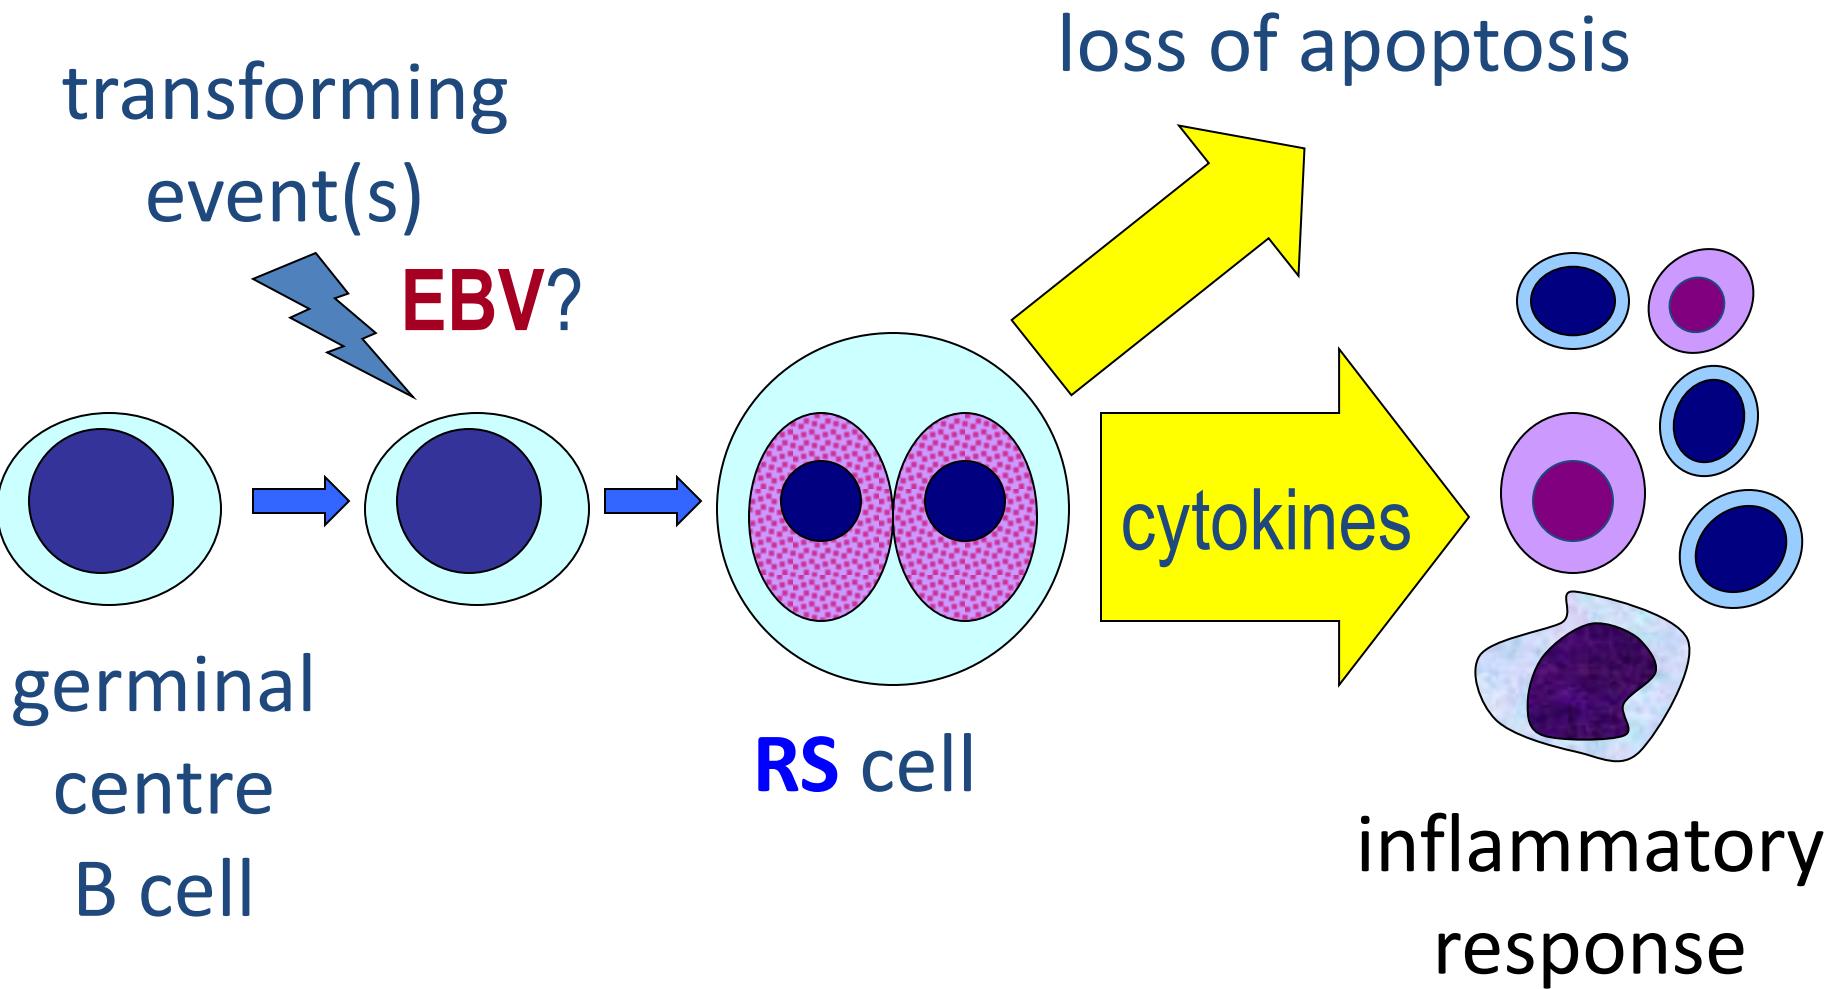

Classical Hodgkin Lymphoma

Indolent malignant lymphoma characterized by :

- 1- presence of few large binucleated cells (Reed-Sternberg) surrounded by reactive cells (lymphocytes, plasma cells ,eosinophils)
- 2- Involving cervical lymph nodes in young adults (most often)

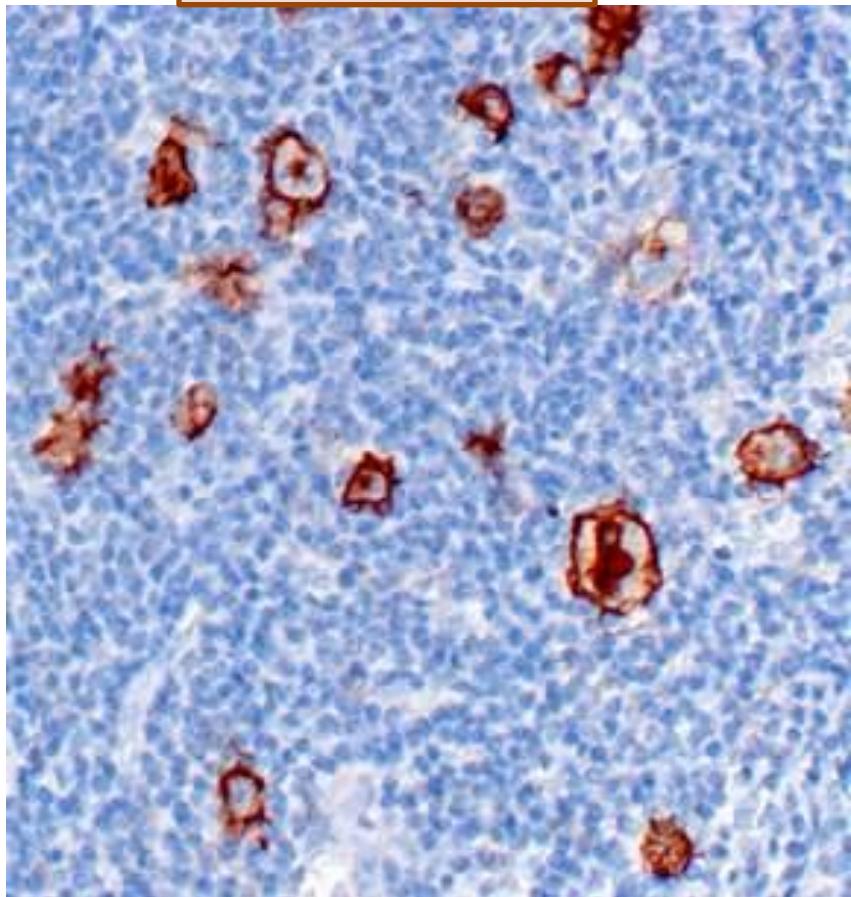

A possible model of pathogenesis
