ENDOCRINOLOGY

Dr. Hana Alzamil

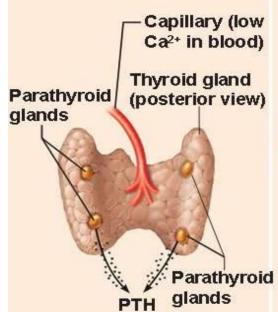

PITUITARY GLANDS

- Anterior pituitary hormones
 - GH
 - Physiological functions
 - Regulation of GH secretion
 - Feedback mechanism
 - Factors controlling secretion
 - Prolactin
 - Physiological functions
 - Regulation of prolactin secretion

ENDOCRINE GLAND STIMULI MAY BE HUMORAL, NEURAL, OR HORMONAL.

(a) Humoral Stimulus

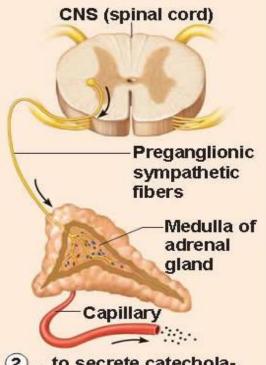

1 Capillary blood contains low concentration of Ca²⁺, which stimulates...

2 ...secretion of parathyroid hormone (PTH) by parathyroid glands*

(b) Neural Stimulus

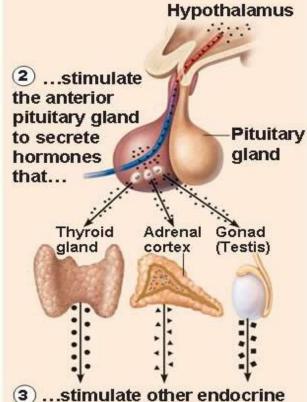

1 Preganglionic sympathetic fibers stimulate adrenal medulla cells...

(2) ...to secrete catecholamines (epinephrine and norepinephrine)

(c) Hormonal Stimulus

1 The hypothalamus secretes hormones that...

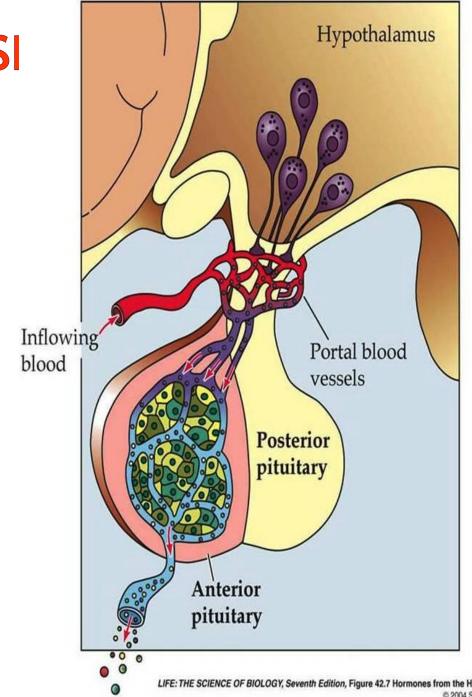

3) ...stimulate other endocrine glands to secrete hormones

(ADENOHYPOPHYSI

Anterior pituitary gland (adenohypophysis)

is connected to hypothalamus by portal system: "hypothalamichypophysial portal vessels".

ANTERIOR PITUITARY HORMONES

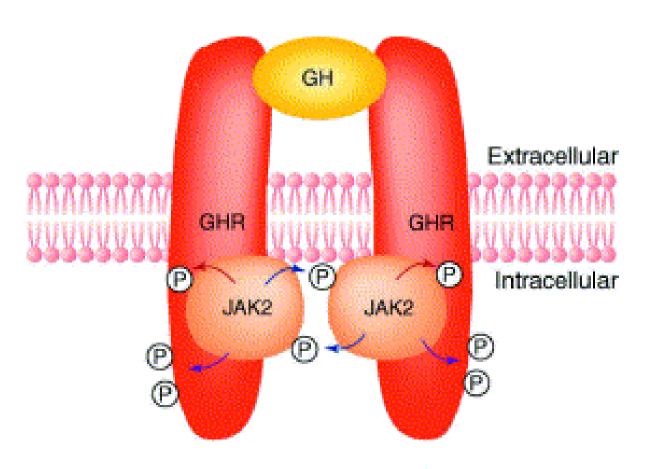

GROWTH HORMONE

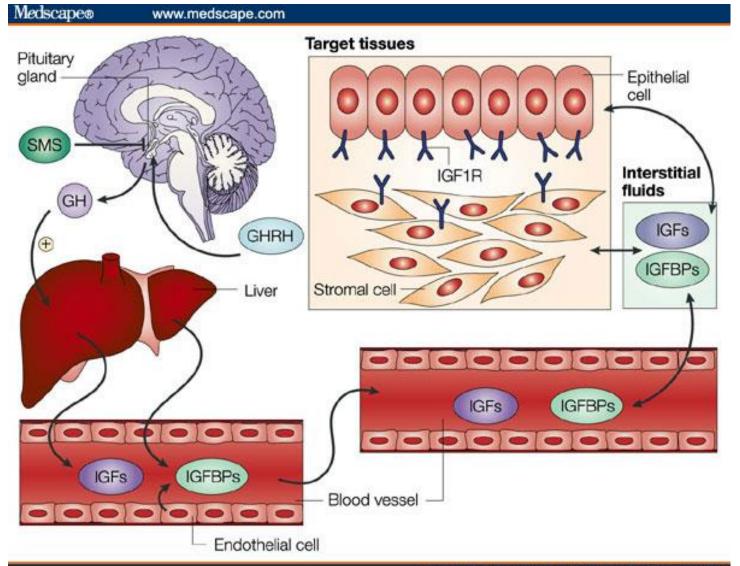

(Somatotropin)

MECHANISM OF ACTION DIRECT EFFECT

TRENDS in Endocrinology & Metabolism

INDIRECT EFFECT SOMATOMEDINS

- A) Long term effect Promotion of growth:
 - ↑ cellular sizes & ↑ mitosis
 - † tissue growth & organ size

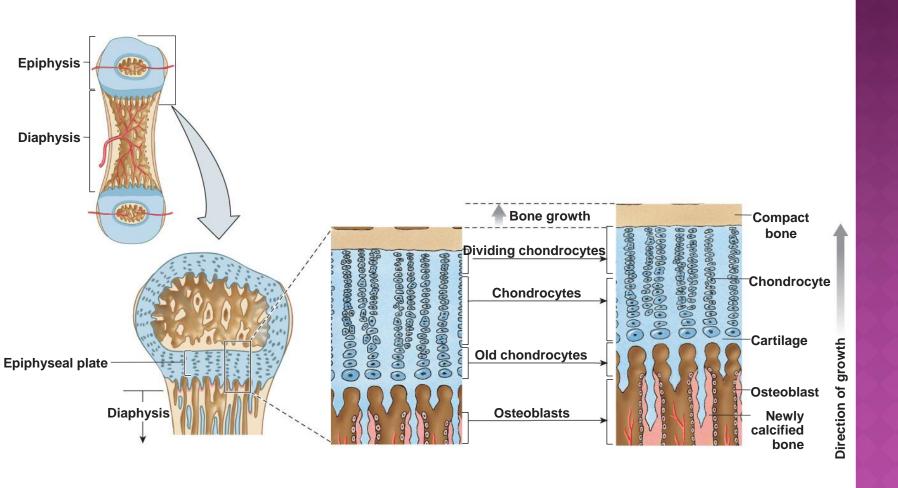

Indirect effect

Depends on somatomedin 'insulin- like growth factor [IGF-I& II] secreted by the liver, which is responsible for effect of GH on bone & cartilage growth and increase the synthesis of protein in skeletal muscles.

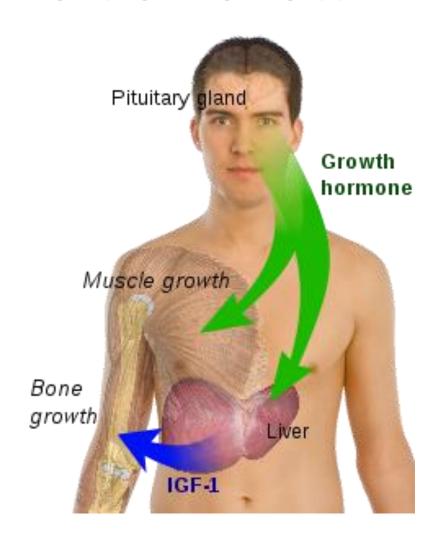

MECHANISMS OF BONE GROWTH

- 1. Linear growth of long bones:
 - Long bones grow in length at epiphyseal cartilages, causing deposition of New Cartilage (↑collagen synthesis) followed by its conversion into bone.
 - When bony fusion occurs between shaft & epiphysis at each end, no further lengthening of long bone occur.
- 2. Deposition of **New Bone** (↑ cell proliferation) on surfaces of older bone & in some bone cavities, ↑ thickness of bone.
 - Occurs in membranous bones, e.g. jaw, & skull bones.

BONE GROWTH

PROMOTION OF GROWTH

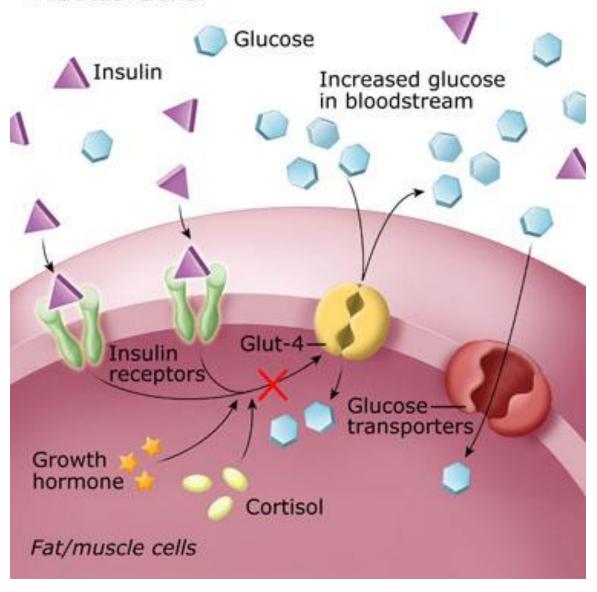

- B. Short term
 Metabolic effects:
 - Protein metabolism (Anabolic)
- 1 rate of protein synthesis in all cells through:
- ^ amino acids transport into cells
- DNA transcription= RNA synthesis
- TRNA translation= protein synthesis
- ↓protein catabolism "protein sparer"

- □ Fat metabolism: Catabolic
 - †mobilization of FFAs from adipose tissue stores
 - Conversion of FFT to acetyl CoA to provide energy

- CHO metabolism: Hyperglycemic
 - ↓ glucose uptake by tissues (skeletal muscles and fat).
 - ↓ rate of glucose utilization throughout the body
 - †glucose production by the liver († gluconeogenesis)
 - † insulin resistance (†FFA)
 (diabetogenic)

Glucose Counter-regulatory Hormones: Effect on Fat and Muscle Cells

OTHER EFFECTS OF GROWTH HORMONE:

- Increases calcium absorption from GIT
- Strengthens and increases the mineralization of bone
- Retention of Na⁺ and K⁺
- Increases muscle mass
- Stimulates the growth of all internal organs excluding the brain
- Contributes to the maintenance and function of pancreatic islets
- Stimulates the immune system

CONTROL OF GH SECRETION:

- 1. The hypothalamus:
 - a. GHRH $\rightarrow \uparrow$ GH secretion.
 - b. GHIH (somatostatin) $\rightarrow \downarrow$ GH secretion
- **2.** Hypoglycemia (fasting) $\rightarrow \uparrow$ GH secretion.
 - (N.B. glucose intake $\rightarrow \downarrow$ GH secretion).
- 3. \downarrow FFAs \rightarrow \uparrow GH secretion
 - \uparrow **FFAs** $\rightarrow \downarrow$ GH secretion

CONTROL OF GH SECRETION:

- 4. Intake of protein or amino acids $\rightarrow \uparrow$ GH secretion (after meals).
- 5. Starvation & protein deficiency ↑ GH
- **6. During sleep** $\rightarrow \uparrow$ more in children.
- **7. Stress conditions**, e.g. trauma or emotions → ↑ GH secretion.
- **8.** Ghrelin (stomach) $\rightarrow \uparrow$ GH secretion.
- **9.** Muscular exercise $\rightarrow \uparrow$ GH secretion.

TABLE 16.1

Pituitary Hormones: Summary of Regulation and Effects

HORMONE (CHEMICAL STRUCTURE AND CELL TYPE)

REGULATION OF RELEASE

TARGET ORGAN AND EFFECTS

EFFECTS OF HYPOSECRETION ↓
AND HYPERSECRETION ↑

Anterior Pituitary Hormones

Growth hormone (GH) (Protein, somatotroph) Stimulated by GHRH* release, which is triggered by low blood levels of GH as well as by a number of secondary triggers including hypoglycemia, increases in blood levels of amino acids, low levels of fatty acids, exercise, other types of stressors, and estrogens

Inhibited by feedback inhibition exerted by GH and IGFs, and by hyperglycemia, hyperlipidemia, obesity, and emotional deprivation via either increased GHIH* (somatostatin) or decreased GHRH* release

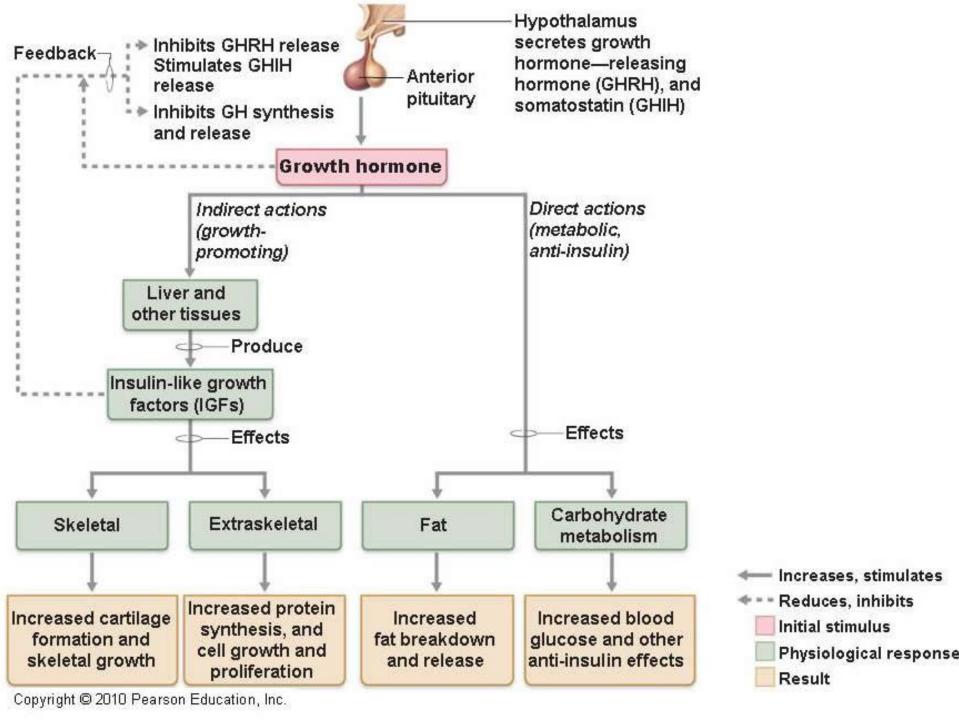

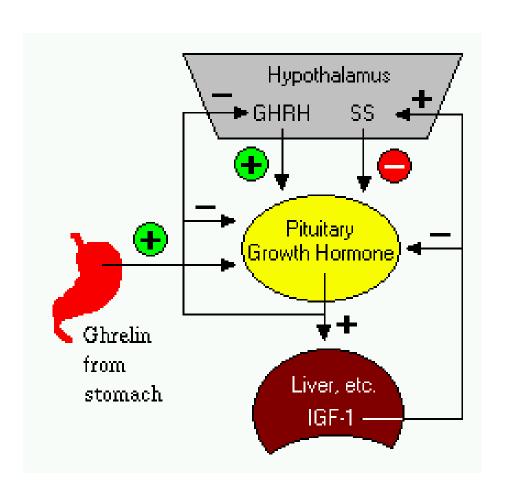

Liver, muscle, bone, cartilage, and other tissues: anabolic hormone; stimulates somatic growth; mobilizes fats; spares glucose

Growth-promoting effects mediated indirectly by IGFs ↓ Pituitary dwarfism in children

Gigantism in children; acromegaly in adults

^{*}Indicates hypothalamic releasing and inhibiting hormones:

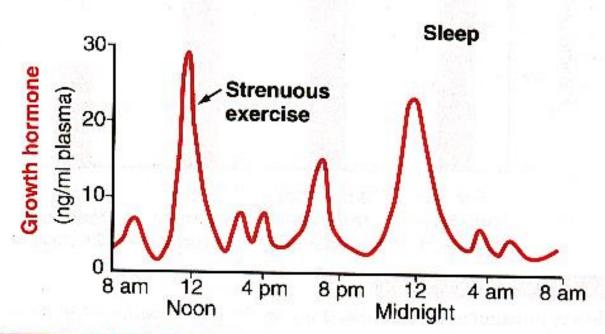

FIGURE 75-6

Typical variations in growth hormone secretion throughout the day, demonstrating the especially powerful effect of strenuous exercise and also the high rate of growth hormone secretion that occurs during the first few hours of deep sleep.

ABNORMALITIES OF GH SECRETION

T GH SECRETION:

- Signs & symptoms 'in childhood': Gigantism,
- as all body tissues grow rapidly, including bones.

Height ↑ as it occurs before epiphyseal fusion of long bones with their shafts.

Hyperglycemia (diabetes).

Signs & symptoms 'in adults':

Acromegally

person can't grow taller, BUT soft tissue continue to grow in thickness (skin, tongue, liver, kidney, ...)

- Enlargement of bones of hands & feet.
- Enlargement of membranous bones including cranium, nose, forehead bones, supraorbital ridges.
 - Protrusion of lower jaw.
- Hunched back (kyphosis) (enlargement of vertebrae).

TGH IN CHILDREN

TGH IN AN ADULT

JGH = PITUITARY DWARFISM

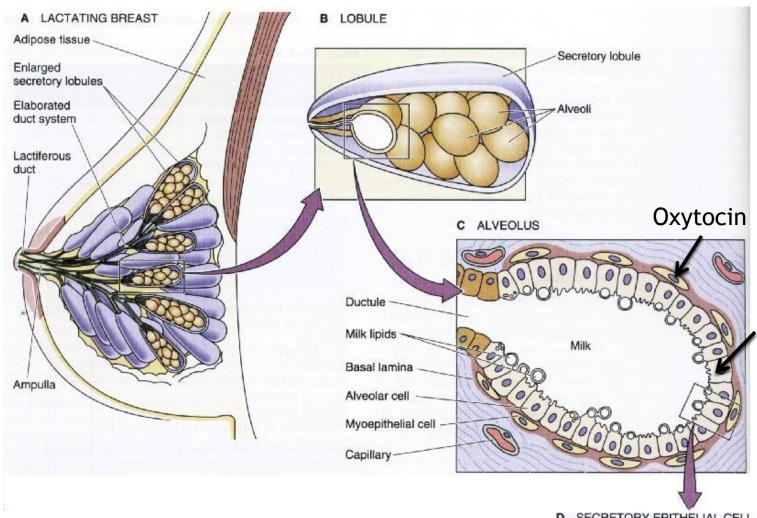

PROLACTIN

FUNCTIONS OF PROLACTIN

- The major function of prolactin is milk production
- Release is inhibited by PIH (dopamine)
- Suckling response inhibits PIH release

Prolactin

D SECRETORY EPITHELIAL CELL

FUNCTIONS OF PROLACTIN

Effect on the breast

- Increases mRNA
- Increases production of casein and lactalbumin
- Inhibits the effects of gonadotropins

Other effects

 Stimulates the secretion of dopamine in median eminence (inhibits its own secretion)

CONTROL OF SECRETION

- Inhibition of PL secretion
 - PIH (Dopamine)
- Stimulation of PL secretion
 - Exercise
 - Surgical & psychological stress
 - Stimulation of the nipple
 - Sleep
 - Pregnancy
 - TRH

Thank you
