

3- Biomarkers of ovarian cancer and cysts

Polycystic ovarian syndrome (PCOS)

Overview	<ul style="list-style-type: none"> • Formation of multiple small cysts in the ovaries affecting 5-10% of women (20% in some populations). • It is a major cause of infertility in women
Correlates to:	<ul style="list-style-type: none"> • Family history • Obesity (40%) • Hirsutism - Chronic anovulation • Glucose intolerance - Insulin resistance • Hyperlipidemia - Hypertension • Menstrual disorders • Hypersecretion of luteinizing hormone (LH) and androgens (testosterone), • Low levels of SHBG (sex hormone-binding globulin)
Causes	<p>Exact cause of the syndrome is unknown. May be multifactorial (genetic and environmental). Probable causes:</p> <ul style="list-style-type: none"> ○ Insulin resistance causes excessive androgen production in ovaries (common) ○ Abnormalities in ovaries, adrenal and pituitary gland
Diagnosis	<p>European Society for Human Reproduction & Embryology (ESHRE) and American Society for Reproductive Medicine (ASRM) recommendation:</p> <ul style="list-style-type: none"> • At least two of the following features are required for PCOS diagnosis: <ol style="list-style-type: none"> 1. Oligo-ovulation or anovulation: manifested as oligomenorrhea or amenorrhea 2. Hyperandrogenism (clinical and biochemical evidence of androgen excess) 3. Polycystic ovaries (as defined by ultrasonography) • PCOS diagnosis done by measuring: <ul style="list-style-type: none"> ○ High Free testosterone (total testosterone is less sensitive) ○ Low Sex hormone-binding globulin (SHBG) ○ High Luteinizing hormone (LH) in 60% cases ○ Normal or decreased Follicle stimulating hormone (FSH) ○ Fasting blood glucose, Insulin, and Lipids • Ovarian ultrasound (30% of patients do not have ovarian cysts despite having symptoms)
Treatment	<ul style="list-style-type: none"> • Aim of treatment: interrupt the cycle of obesity, insulin resistance, excess androgens. <ul style="list-style-type: none"> ○ Reduce LH levels (by oral contraceptives) ○ Reduce body weight ○ Increase FSH levels (by clomiphene, etc.) ○ Estrogen replacement therapy (In selected women after careful risk counseling)

Ovarian cancer

Overview	<ul style="list-style-type: none"> Ovarian cancer is a leading cause of death because of gynecologic cancer Most common type of ovarian cancer is due to malignant transformation of ovarian epithelial cells, Subtypes: <ul style="list-style-type: none"> Serous (46%): surface epithelial tumors Mucinous (36%): mucinous epithelial tumors Endometrioid (8%): endometrial tumors 	
Risk factors	<ul style="list-style-type: none"> Nulliparity (woman with no child birth or pregnancy) Family history of breast, ovarian, colorectal cancer <ul style="list-style-type: none"> Mutations in BRCA1 and BRCA2 genes (most common) Carriers of BRCA1 mutations have a cancer risk of 44% Premenopausal breast cancer or ovarian cancer indicates higher risk for hereditary or breast cancer Ashkenazi Jews have higher risk of ovarian cancer. 	
Biomarkers and diagnosis	<ul style="list-style-type: none"> Epithelial ovarian cancer is commonly diagnosed at a later stage, due to non-specific symptoms such as <u>abdominal pain, blotting, early satiety, nausea</u>, etc. Most patients (75%) have advanced-stage tumor upon diagnosis Diagnosis includes: <ul style="list-style-type: none"> History taking Physical examination Ultrasound Measurement of serum CA-125 levels 	<div style="background-color: #e0f0e0; padding: 5px; text-align: center;">CA-125</div> <ul style="list-style-type: none"> The only serum marker of epithelial ovarian cancer It is a cell surface glycoprotein expressed in the epithelium of all tissues. But normally absent in serum. CA-125 is elevated in ovarian cancer (>35 U/ml is considered positive) Recommended as an annual test for women with family history of ovarian cancer CA-125 is associated with stages of ovarian cancer. Elevated in: <ul style="list-style-type: none"> 50% of patients with stage I 90% of patients with stage II >90% of patients with stage III and IV A non-specific marker, as false positive CA-125 conc. are found in benign conditions: <ul style="list-style-type: none"> Endometriosis - Uterine leiomyomas - Pelvic inflammatory disease During the first trimester of pregnancy - During menstruation Some patients (< 50 years) have ↑ CA-125 due to unrelated malignant mass CA-125 is not a marker of choice for ovarian cancer screening due to: <ul style="list-style-type: none"> Low prevalence of ovarian cancer, and high false-positive rate Useful in Monitoring: <ul style="list-style-type: none"> patient's response to chemotherapy Success of surgery (de-bulking procedures)
