

Organization of The Nervous System

PROF. Musaad Alfayez

Objectives

By the end of the lecture, you should be able to:

- List the parts of the nervous system.
- List the function of the nervous system.
- Describe the Structural & Functional Organizations.
- **Define the terms:**
- Nervous tissue, grey matter, white matter, nucleus, ganglion, tract and nerve.
- List the **parts** of the brain.
- List the structures protecting the central nervous system.

INTRODUCTION

How does the nervous system work ?

The nervous system has three functions:

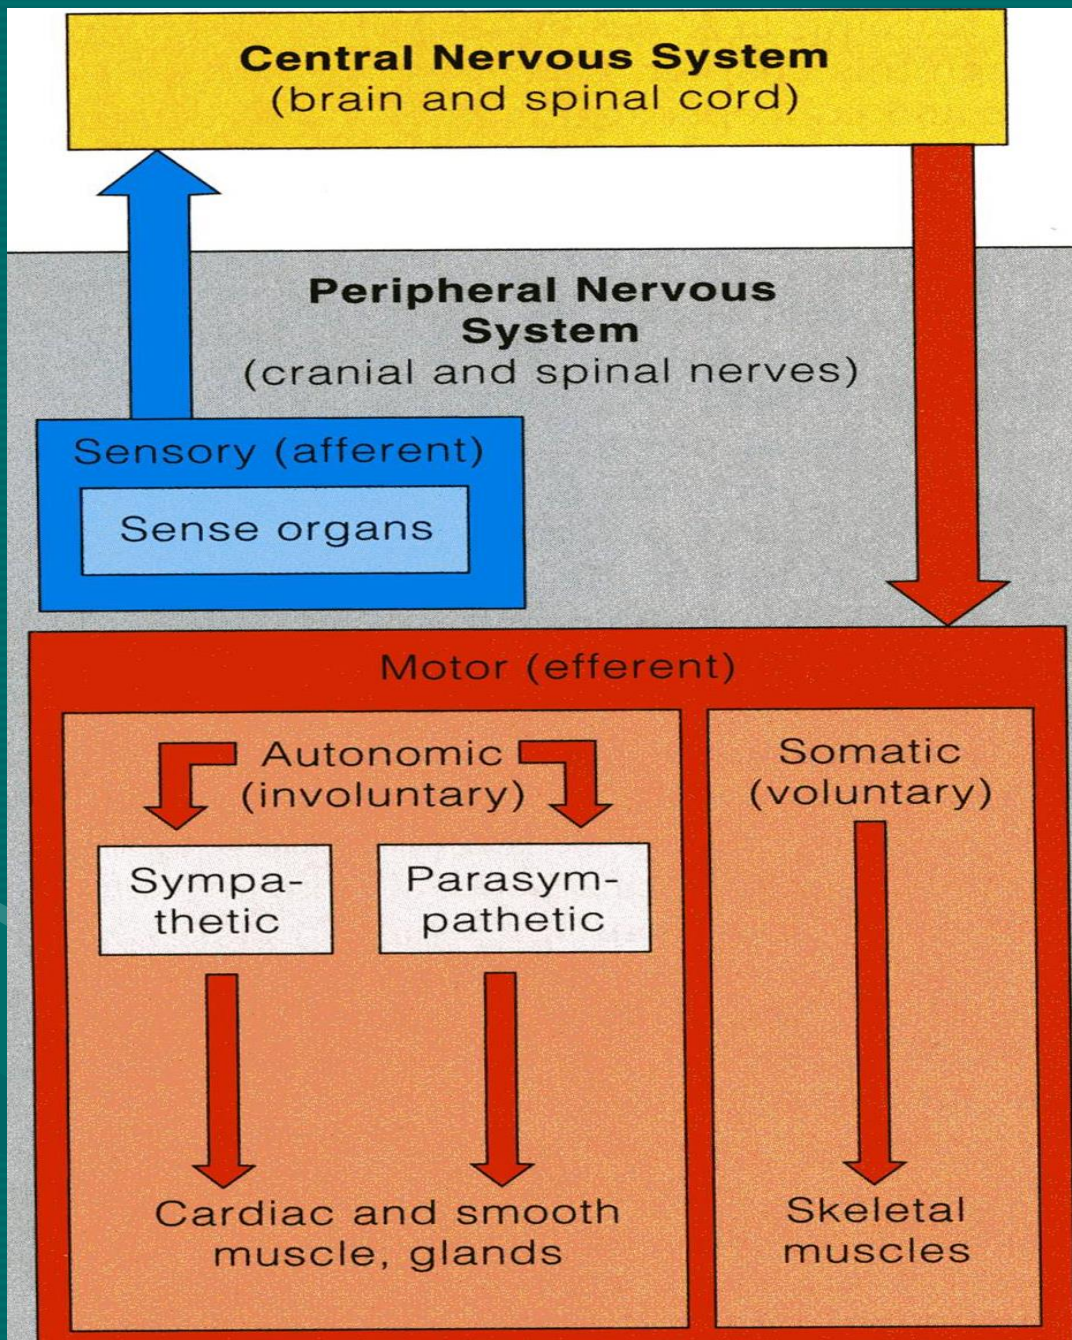

- Collection of sensory input:

Identifies changes occurring inside or outside the body by using **sensory receptors**. These changes are called **stimuli**.

- Integration:

Processes, analyzes and interprets these changes and makes decisions.

- Motor output, or **response** by activating muscles or glands (effectors).

CLASSIFICATION

I- Anatomical or structural classification:

1- Central NS

- 2- Peripheral NS

II- Physiological or functional classification:

- **1-Sensory division (Afferent)**

- **2-Motor division (Efferent)**

- **Autonomic**

- **Somatic**

The Nervous System

- It is the major,
- **Controlling, Regulatory and Communicating** system in the body.
- It is the center of all mental activity including:
 - **Thought,**
 - **Learning,**
 - **Behavior and**
 - **Memory.**
- Together with the endocrine system, the nervous system is responsible for regulating & maintaining **homeostasis.**

Structural Organization

Two subdivisions:

- **Central Nervous System (CNS)**
 - Consists of **Brain & Spinal cord.**
 - Occupies the dorsal body cavity.
 - Acts as the integrating and command centers.
- **Peripheral Nervous System (PNS)**
 - Consists of **nerves, ganglia, and receptors.**
 - **It is the** part of the nervous system outside the CNS.

Functional Organization

- Two subdivisions:
 - Sensory or afferent division:
Consists of nerve fibers that convey impulses from receptors located in various parts of the body, to the CNS.
 - Motor or efferent division:
Consists of nerve fibers that convey impulses from the CNS to the effector organs, muscles and glands.
- Both sensory and motor subdivisions are further divided into:
 - Somatic division: concerned with **s**kin, **s**keletal muscles and joints.
 - Autonomic division: concerned with the visceral organs.

Nervous Tissue

- Nervous system is composed of **nervous tissue**, which contains two types of cells:
 - 1- **Neurons** or Nerve cells.
 - 2- **Neuroglia (glial cells)** or Supporting cells.
- Nervous system contains millions of **neurons** that vary in their shape, size, and number of processes.

Neurons

What is neurone?

It is the basic structural (anatomical), functional and embryological unit of the nervous system.

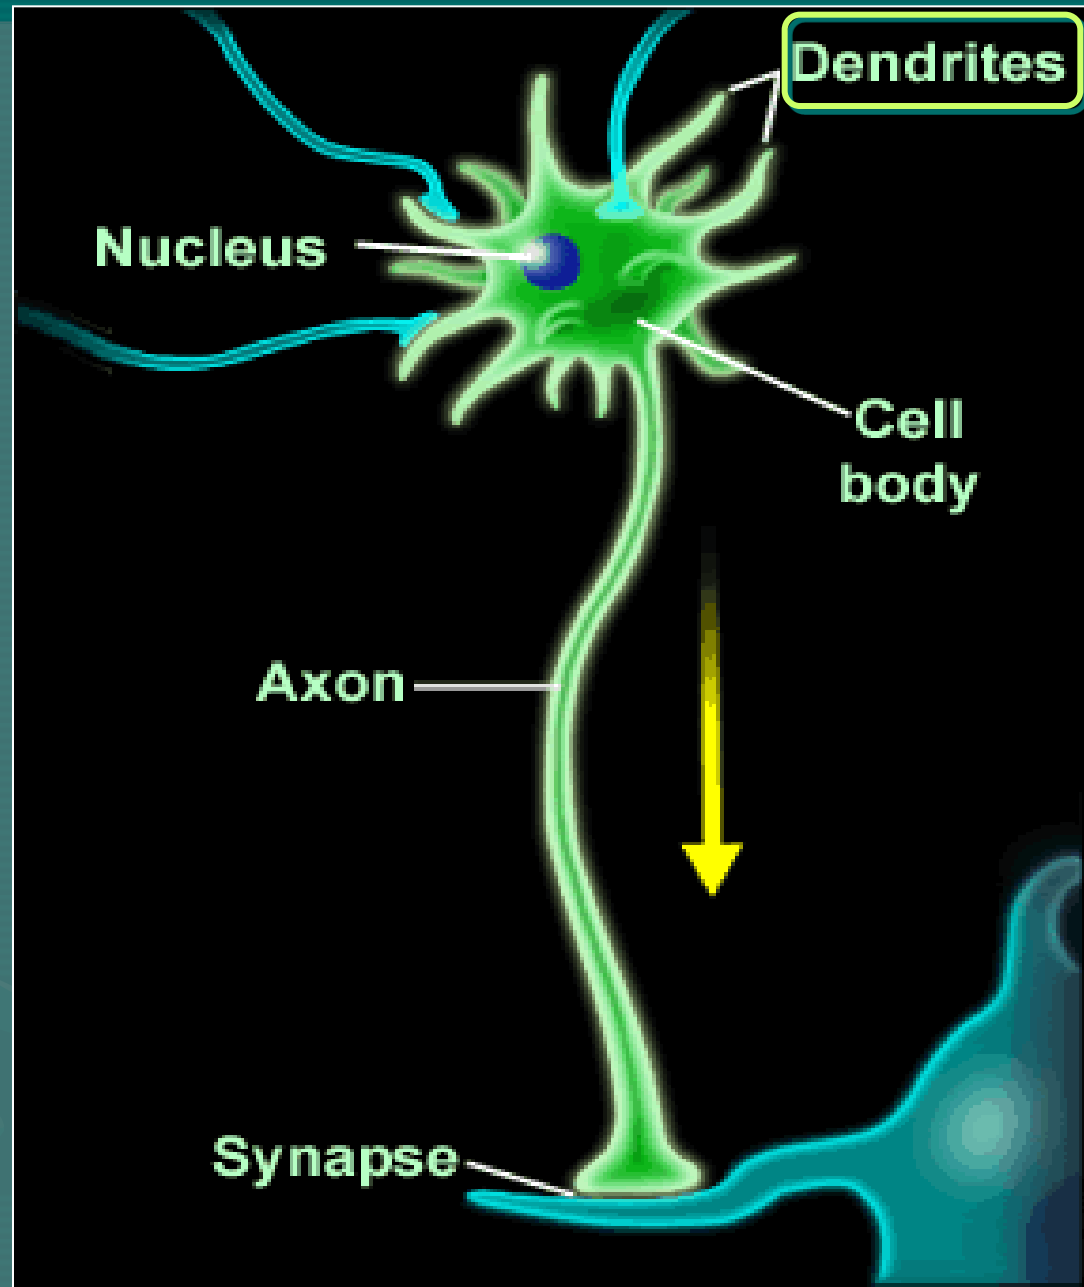

The human nervous system is estimated to contain about 10^{10} neurons.

Dendrites

The neuron has cell body with multiple processes.

Most of the processes are short with variable numbers and are **receptive** in function.

They are known as **Dendrites**.

Axon

- **One** of these processes leaving the cell body is called the **axon** which carries information away from the cell body.
- Axons are highly variable in length and may divide into several branches or **collaterals** through which information can be distributed to a large number of different destinations.
- At the end of the axon, specializations called **terminal buttons** occur.
- Here information is transferred to the dendrites of other neurones.

Synapse or Relay

The junction site of two neurons is called a “**synapse or relay**”.

In the synapses the membranes of adjacent cells are in close apposition (**contiguity**=contact, not **continuity**).

Nervous tissue is organized as:

Grey matter, Which contains

- 1- Cell bodies &
- 2- Processes of the neurons,
- 3- Neuroglia and
- 4- Blood vessels.

White matter, Which contains:

- 1- Processes of the neurons
- 2- Neuroglia and
- 3- Blood vessels

NO cell bodies in the white matter.

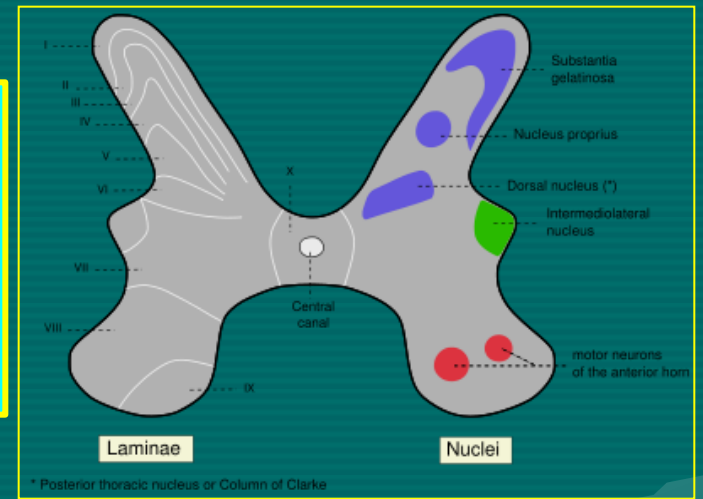

Gray matter

White matter

Ganglion = A group of neurons **outside** the CNS

Nucleus = A group of neurons **within** the CNS

Remember...

Nerve = A group of nerve fibers (axons) **outside** the CNS

Tract = A group of nerve fibers (axons) **within** the CNS

Spinal Cord

- Elongated almost cylindrical suspended in the vertebral canal, surrounded by the meninges and cerebrospinal fluid.
- Approximately 45 cm long in adult and is about the thickness of the little finger.
- It extends from the foramen magnum to the upper border of the 2nd lumbar vertebra.
- Continuous above with the medulla oblongata.
- Its lower end is called conus medullaris.
- Gives rise to **31 pairs** of spinal nerves:
 - 8 Cervical,
 - 12 Thoracic,
 - 5 Lumbar,
 - 5 Sacral and
 - ONE Coccygeal.

- Spinal nerves supplying the upper or lower limbs form **plexuses** e.g. **brachial** or **lumbar plexus**.
- Nerve cell bodies that are aggregated outside the CNS are called **GANGLIA**

Autonomic Nervous System

- Neurones that detect changes and control the activity of the viscera are collectively referred to as the **autonomic nervous system**.
- Its components are **present in** both the central and peripheral nervous systems.

SYMPATHETIC & PARASYMPATHETIC SYSTEMS

- The autonomic nervous system is divided into two anatomically and functionally distinct parts:
- Sympathetic: Or
- **Thoracolumbar outflow**
- Parasympathetic: Or
- **Craniosacral outflow.**
- **Sympathetic and parasympathetic**, divisions are generally have antagonistic effects on the structures that they innervate.
- E.g. Sympathetic **increases** the heart rate, while the parasympathetic **decreases** the heart rate.

- The autonomic nervous system innervates:
- Smooth muscles,
- Cardiac muscle,
- Secretory glands.
- It is an important part of **the homeostatic mechanisms** that control the internal environment of the body with the endocrine system.

PARTS OF THE BRAIN

- The brain composed of 4 parts:
 1. Cerebral hemispheres.
 2. Diencephalon.
 3. Cerebellum.
 4. Brain stem.

CEREBRAL HEMISPHERES

- The largest part of the brain.
- They have elevations, called **gyri**.
- Gyri are separated by depressions called **sulci**.
- Each hemisphere is divided into **4 lobes named according to the bone above**.
- Lobes are separated by deeper grooves called **fissures or sulci**.

TISSUE OF THE CEREBRAL HEMISPHERES

(b) Anterior view of frontal section

- The outer layer is the **gray matter** or cortex
- Deeper is located the **white matter**, composed of bundles of nerve fibers, carrying impulses **to and from** the cortex
- **Basal nuclei** are gray matter that are located deep within the white matter
- They help the motor cortex in regulation of **voluntary motor activities.**

DIENCEPHALON

The diencephalon is located between the 2 cerebral hemispheres and is linked to them and to the brainstem.

The major structures of the diencephalon are the **Thalamus**, **Hypothalamus**, **Subthalamus** and **Epithalamus**.

BRAIN STEM

It is connected to the cerebellum with 3 paired peduncles Superior, middle and inferior

The brainstem has three parts: **midbrain**, **Pons** and **medulla oblongata**.

CEREBELLUM

Cerebellum has 2 cerebellar hemispheres with convoluted surface. It has an outer cortex of gray matter and an inner region of white matter. It provides precise coordination for body movements and helps maintain equilibrium.

MENINGES

- There are three connective tissue membranes invest the brain and the spinal cord.
- These are from outward to inward are:
 - 1- **Dura mater.**
 - 2- **Arachnoid mater.**
 - 3- **Pia mater.**

BRAIN VENTRICLES

- Brain is bathed by the cerebrospinal fluid (CSF).
 - Inside the brain, there are **4 ventricles** filled with CSF.
 - The 4 ventricles are:
 - **2 lateral ventricles:**
One in each hemispheres.
 - **3rd ventricle:**
in the Diencephalon.
 - **4th ventricle:**
between Pons, Medulla oblongata & Cerebellum.
- N.B. Cerebral aqueduct:**
connects the 3rd to the 4th ventricle.

CSF is constantly produced by the choroid plexuses inside the ventricle.

CEREBROSPINAL FLUID

Inside the brain, CSF flows from the lateral ventricles to the 3rd and 4th ventricles

From the 4th ventricle, part of the CSF flows down in the central canal of the spinal cord.

Most of the CSF drains from the 4th ventricle to distribute in the subarachnoid space around the brain and returns to the dural sinuses through the arachnoids villi.

- Arachnoid villi are small protrusions of the arachnoid (the second layer covering the brain) through the dura.
- Villi absorb cerebrospinal fluid and return it to the dural venous circulation.

**THANK YOU
AND GOOD
LUCK**
