Lecture Title: BRAIN STEM AND CEREBELLUM.

(CNS Block, Radiology)

Dr. Hamdy Hassan Ass.Prof. Consultant Radiology Department KKHU King Saud University

Lecture Objectives..

Students at the end of the lecture will be able to:

- Identify radiological anatomy of brain stem and cerebellum.
- Compares CT and MRI imaging of brain stem and cerebellum.
- Recognize the imaging findings in common diseases involving brain stem and cerebellum.

Brain Divisions..

• There are three major divisions of the brain:

I ProsencephalonForebrainDiencephalonthalamus, hypothalamusTelencephaloncerebrum

II Mesencephalon – Midbrain

III Rhombencephalon - Hindbrain Metencephalon pons and cerebellum Myelencephalon medulla oblongata

Brain Stem..

- Three parts from superior to inferior:

 1 midbrain
 2 pons
 3 medulla oblongata
- Connects cerebral hemisphere with spinal cord

Midbrain..

Radiological Features:

- At the level of circle of willis
- Anteriorly two cerebral peduncles separated by interpeduncular fossa
- Posteriorly four rounded prominences (superior and inferior colliculi)

CT+

MRI T2WI

Midbrain..

MRI Sagittal T1WI

MRI axial T2WI

- 1 superior colliculus
- 2 inferior colliculus
- 3 cerebral peduncle
- 4 interpeduncular cistern

Midbrain..

Internal features:

substantia nigra separates crus cerebri ventrally from tegmentum posteriorly. Red nuclei are dorsal to substantia nigra at the level of superior colliculi

Pons..

Radiological Features:

- The bulbous anterior part consists mainly of fibres continuous on each side with middle cerebellar peduncle
- Basilar artery lies in groove anteriorly
- Posterior surface of the pons forms the upper part of the floor of the 4th ventricle.
- Bony anterior relation: clivus centrally and petrous temporal bones laterally

Pons.

- P pons
- **1** 4th ventricle
- 2 basilar artery
- 3 middle cerebellar peduncle

Medulla oblongata..

Radiological Features:

- MRI imaging of the medulla gives superior images to CT due to lack of bony artifact
- The ventral median fissure is seen anteriorly with the pyramid laterally
- The 4th ventricle is seen posteriorly

CT+

MRI axial T2WI

medulla

Radiological Features:

On axial Ct & MRI the cerebellum is separated from the pons by the 4th ventricle and connected to the pons on each side by middle cerebellar peduncle, it is bounded anteriorly by petrous temporal bone

On higher slices it is separated from temporal and occipital lobes anterolaterally by tentorial margins, tentorium can be seen on contrast enhanced studies owing to the contained superior petrosal sinus

Radiological Features:

- Cerebellum is connected to the brainstem by three pairs of cerebellum peduncles:
 Superior......connected to the midbrain Middle.....connected to the pons inferior.....connected to medulla oblongata
- Two cerebellar hemisphere with midline vermis
- Flocculus is a small ventral portion of the hemisphere
- Tosils are the most anterior inferior part of the hemispheres that lie close to the midline

axial CT

tonsil

MRI sagittal T1WI

CT+

Radiological Features:

The superior vermis can be seen between occipital lobes on section through the thalamus.

Fig. 2.16 Midline sagittal T₂ MRI to show vermis of cerebellum.

 Lingula on superior medullary velum
 Primary fissure Horizontal fissure
 Prepyramidal fissure
 Foramen of Magendi

Cerebellar Vermis

Acute infarction due to basilar artery thrombosis

Diffusion sequence

Acute infarction due to basilar artery thrombosis

Brain stem glioma

Sag MRI T1WI contrast

axial MRI T2WI

axial MRI T1WI contrast

Medulloblastoma

Sag MRI T1WI contrast

axial MRI T1WI contrast

Coronal MRI T1WI contrast

Ependymoma

Sag MRI T1WI

axial MRI T2WI

Coronal MRI T1WI contrast

Hemangioblastoma

Cavernous angioma

axial MRI T2WI

axial MRI T1 contrast

Cerebellar tuberculosis

axial MRI T1 contrast

TB meningitis with multiple tuberculomas
