

PHYSIOLOGY OF THE BRAIN STEM

Dr Syed Shahid Habib
Professor & Consultant Clinical Neurophysiology
Dept. of Physiology
College of Medicine & KKUH
King Saud University

9/8/2018

OBJECTIVES

At the end of this lecture the student should be able to :

- *Enumerate Components of Brain stem*
- *List Important structures in brain stem*
- *Describe Functions of the Brain Stem*
- *Describe Signs & Symptoms of brain stem lesion*
- *Understand brain stem function tests*

A sample Case

A 58 y/o female patient was referred to you because of recent onset of left hemiparesis, left-sided loss of proprioception and right-sided tongue deviation. What CNS structures are affected?

Explain the symptoms with regards to structures affected.

Where is the lesion?

Functions of the Brain Stem

Though it is small, brain stem is an extremely important part of the brain:

1. A Conduct structure (way station) .
2. Provides the origin of the cranial nerves (CN III-XII).
3. **Conjugate eye movement** motor coordination of the eyes that allows for bilateral fixation on any object.
4. Many many Integrative functions.

Brain Stem Functions

- 1. Control of respiration**
- 2. Control of the cardiovascular system**
- 3. Partial control of gastrointestinal function**
- 4. Control of many stereotyped movements of the body**
- 5. Control of equilibrium**
- 6. Control of eye movements**

Brain Stem Functions (cont.)

- The **autonomic nervous system** is activated mainly by centers located in the spinal cord, brain stem, and hypothalamus (Cardiovascular Gastrointestinal Autonomic Reflexes.)
- Functions of Brain Stem Nuclei in **Controlling Subconscious, Stereotyped Movements** [crying, yawn, suckling, stretch] (anencephaly)
- Motor branch of the fifth cranial nerve, and the **chewing** process is controlled by nuclei in the brain stem and also **swallowing, salivary secretion, vomiting** (chemoreceptor trigger zone). The actual mechanics of feeding are controlled by centers in the brain stem.
- Vasomotor center** for CV control (Baroreceptors) in medulla and **Respiratory Nuclei**
- Brain stem **Neurohormonal Systems** in the human brain for activating four neurohormonal systems
- Many of the **behavioral functions** elicited from the hypothalamus and other limbic structures are also mediated through the reticular nuclei in the brain stem and their associated nuclei.

Brain Stem Functions (cont.)

- Although the **micturition reflex** is an autonomic spinal cord reflex, it can also be inhibited or facilitated by centers in the cerebral cortex or brain stem in pons
- **Accommodation** Is Controlled by Parasympathetic Nerves by 3rd CN
- Neural Pathways for Control of **Eye Movements**. also shows brain stem nuclei for the third, fourth, and sixth cranial nerves by medial longitudinal fasciculus
- **Auditory Nervous Pathways** → superior olivary nucleus
- Nucleus of tractus solitarius → **Taste pathway** → Sup & Inf Salivatory Nuclei
- Bulboreticular facilitatory area of brain stem for **gamma efferent system** (stabilizes joints)
- Control of Cerebral Activity by Continuous Excitatory Signals from the Brain Stem (**Reticular Excitatory Area of the Brain Stem** → bulboreticular facilitatory area → it is the same brain stem reticular area that transmits facilitatory signals to maintain tone in the antigravity muscles and spinal cord reflexes.

INTEGRATIVE FUNCTIONS

- It controls **consciousness & sleep cycle** (alertness and arousal) through reticular formation.
- It has centers for **cough, gag, swallowing and vomiting.**
- Sense of body **balance** (Vestibular functions)
- Substantia nigra which is a part of the basal ganglia is present in midbrain and is involved in **control of movements.**
- Midbrain also contain **red nucleus** which regulate the motor activity through cerebellum.
- Inferior and superior colliculi are situated on the dorsal surface of the midbrain and is involved in **auditory & visual processing** required for head movements.
- **Pain sensitivity control:** Periaqueductal grey matter of mesencephalon is an area which is rich in endogenous opioid and is important in modulation of painful stimuli.

1. Conduct functions (way station)

All information related from the body to the cerebrum and cerebellum and vice versa, must traverse the brain stem.

a) The ascending sensory pathways

- The **spinothalamin** tract for pain and temperature sensation.
- The **dorsal column**, fasciculus gracilis, and cuneatus for touch, proprioceptive and pressure sensation.

b) Descending motor tracts

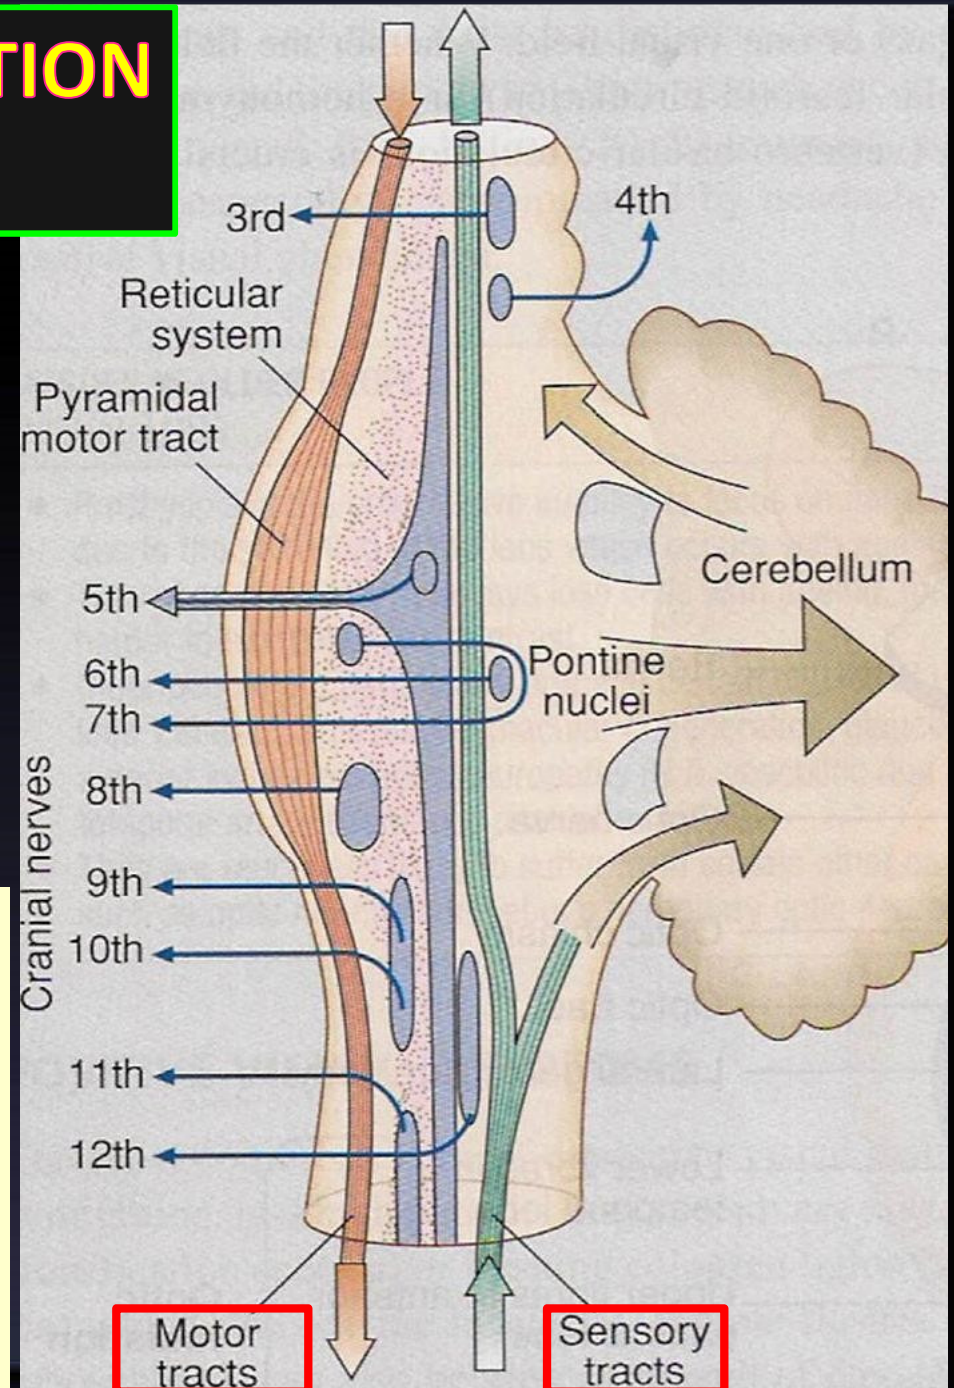

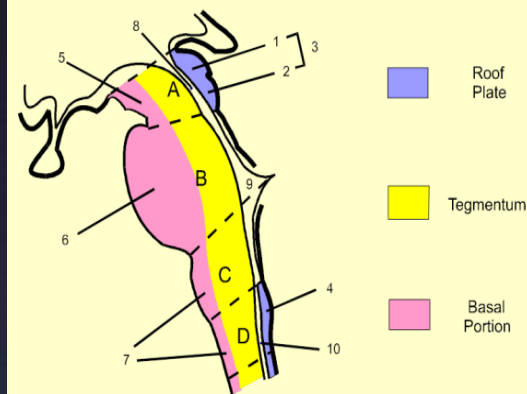

- The **corticospinal tract** (UMN): runs through the crus cerebri, the basal part of the pons and the medullary pyramids; 70-90 % of fibers cross in the pyramidal decussation
- Upper motor neurons that originate in the brain stem's vestibular, red, and reticular nuclei, which also descend and synapse in the spinal cord.

FUNCTIONAL ORGANIZATION OF THE BRAIN STEM

- Ventral layer of brainstem is **MOTOR** in function.
- Middle layer is **SENSORY** in function & contains medial lemniscus which conveys sensory information from dorsal column.

Basic Structure of Brain Stem

1. Roof Plate
2. Tegmentum
3. Basal Portion

Origin & functions of the cranial nerves

FROM MIDBRAIN

- **CN III (oculomotor)**
 - **CN IV (trochlear)**
- Both moves eyes; CN III constricts the pupils, accommodates.

FROM PONS

- **CN V (trigeminal):** Chews and feels front of the head.
- **CN VI (abducens):** Moves eyes.
- **CN VII (facial):** Moves the face, tastes, salivates.
- **CN VIII (acoustic):** Hears, regulates balance.

FROM MEDULLA

- **CN IX (glossopharyngeal):** Tastes, salivates, swallows, monitors carotid body and sinus.
- **CN X (vagus):** Tastes, swallows, lifts palate, talks, communication to and from thoraco-abdominal viscera.
- **CN XI (accessory):** Turns head, lifts shoulder.
- **CN XII (hypoglossal):** Moves tongue.

FUNCTIONS OF MIDBRAIN

- Nerve pathway to cerebral hemispheres.
- Auditory and Visual reflex centers.
- Cranial Nerves:
- CN III - Oculomotor [motor]. (Related to eye movement).
- CN IV - Trochlear [motor]. (Superior oblique muscle of the eye which rotates the eye down and out).

Signs & Symptoms of midbrain lesion

CN Deficits: Ipsilateral CN III, CN IV palsy and ptosis (drooping).

Pupils: Size: Midposition to dilated.

Reactivity: Sluggish to fixed.

Posture: Abnormal extensor response (Lower).

Respiratory: Hyperventilating.

Loss of consciousness (LOC): Varies

FUNCTIONS OF PONS

- Respiratory Center.
- Cranial Nerves:
 - CN V - Trigeminal [motor and sensory]. (Skin of face, tongue, teeth; muscle of mastication).
 - CN VI - Abducens [motor]. (Lateral rectus muscle of eye which moves eye laterally).
 - CN VII - Facial [motor and sensory]. (Muscles of expression).
 - CN VIII - Acoustic [sensory]. (Hearing)

Signs & Symptoms of pons lesion

- **Pupils size:** Pinpoint
- **LOC:** Semi-coma
- **Posture:** Abnormal extensor response.
- **Respiratory:** -Apneustic (Abnormal respiration marked by sustained inhalation). -Hyperventilation.
- **CN Deficits:** CN V, CN VI, CN VII, CN VIII.

FUNCTIONS OF MEDULLA OBLONGATA

- **Crossing of motor tracts.**
- **Cardiac Center.**
- **Respiratory Center.**
- **Vasomotor Center (nerves having muscular control of the blood vessel walls)**
- **Centers for cough, gag, swallow, and vomit.**
- **Cranial Nerves:**
 - **CN IX - Glossopharyngeal [mixed]. (Muscles & mucous membranes of pharynx, the constricted openings from the mouth & the oral pharynx and the posterior third of tongue).**
 - **CN X - Vagus [mixed]. (Pharynx, larynx, heart, lungs, stomach).**
 - **CN XI - Accessory [motor]. (Rotation of the head and shoulder).**
 - **CN XII - Hypoglossal [motor]. (Intrinsic muscles of the tongue).**

Signs and symptoms of lesion in medulla

- **Movement:** Ipsilateral paralysis.
- **Pupils:** **Size:** Dilated. **Reactivity:** Fixed.
- **Respiratory:** Abnormal breathing patterns
- **CN Palsies:** Inability to control movement. Absent cough & gag reflex.
- **LOC:** Comatose.

BRAIN STEM FUNCTION TESTS

- **To test reticular formation**
 - Alertness, Consciousness & Sleep.
- **Corticospinal tract**
 - Motor power, reflexes
- **Pain response**
 - Facial grimacing on firm pressure over the supra orbital ridge.
- **To test respiratory center**
 - look for the normal pattern of respiration

- **To test cardiovascular functions**
 - Look for normal circulatory function
- **To test brainstem reflexes:**
 - Pupillary and corneal reflexes.
 - Vestibulo-ocular reflex: Injection of iced water into the ear will produce eyes movement.
 - Oculo-cephalic reflex: Eyes will be fixed when head is moved in one or another directions.
 - Gag reflex.
 - Cough reflex
