Pharmacology Team 438

# Drugs Used in Headache And Migraine

## Objectives

**By the end of the lecture , you should know:**

- Differentiate between types of headache regarding their symptoms, signs and pathophysiology.
- Recognize drugs used to prevent migraine.
- Identify drugs used to rescue and abort migraine.
- Elaborate on the pharmacokinetics, dynamic and toxic profile of some of these drugs.

1

## Headache

**Pain anywhere in the region of the head or neck.**

• It is caused by disturbance of the Pain-Sensitive Structures around the brain:

- 1) **Within the cranium:** blood vessels, meninges, & cranial nerves.
- 2) **Outside the cranium:** muscles, nerves, arteries, veins, subcutaneous tissues, eyes, ears, and other tissues.

2

## Migraine

**Recurrent attacks of throbbing headache, unilateral<sup>1</sup> or on both sides.**

- Lasting from > 2 up to 72 hrs.
- Preceded (or accompanied) by **AURA**.
- pain is usually on **one side** of head with facial and neck pain, nausea and vomiting.

## Types of Migraine:

▶ **Common:** Without aura ( 80%)

▶ **Classic:** With aura ( 20%)

- ★ **Aura:** Perceptual disturbance of motor < **sensory nature.**
- **Visual:** Photophobia (↑ sensitivity to light)
  - **Auditory:** Phonophobia (↑ sensitivity to sound)
  - **Olfactory** unpleasant smell.
  - **Sensory** abnormal sensation of at face, extremities.
- Develops over 5-20 min & last fewer than 60 min.

## Phases of Migraine

### 1) Pro-drom phase

- A change in mood or behavior (irritability, neck stiffness) that starts hours or days before headache.
- It is experienced by 60% of migraineurs

### 2) Aura-phase

- **Sensory** > motor symptoms starts 5-20 min before the migraine attack. It is experienced by 20% of migraineurs.

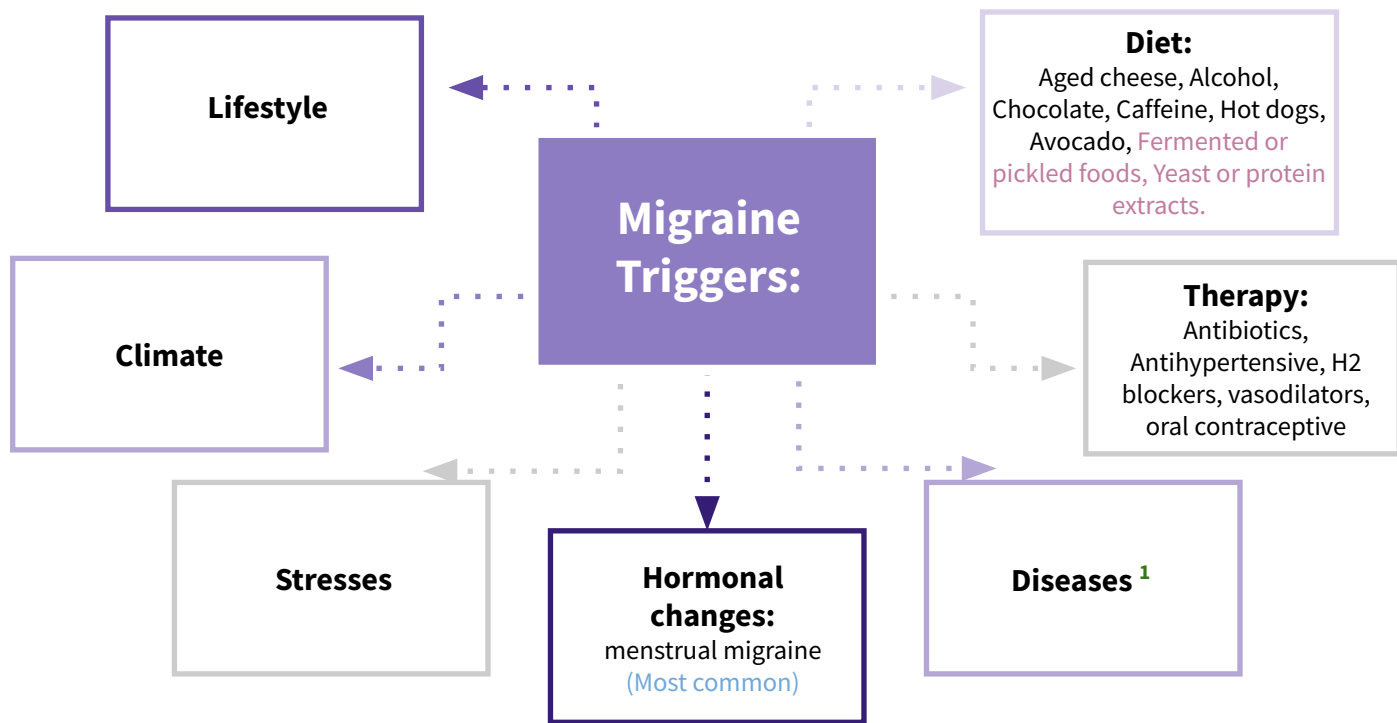

### 3) Headache phase

- Moderate to severe pain, ↑ with activity + anorexia, vomiting.
- **Intolerance to light**, sounds, odors
- Blurry vision, Blocked nose, Pale face, Sensations of heat or coldness, Sweating, & Tenderness of the scalp.

### 4) Post-drom phase

- Still not normal.
- More likely fatigue → irritability, impaired concentration, scalp tenderness, mood changes, & GIT symptoms.

1. One part of the head

## Migraine Causal Theories

### 1 | Vascular

### 2 | Cortical Spreading Depression

### 3 | Dopaminergic Hypersensitivity

**Triggers** → Intracranial vasoconstriction → migraine aura → focal ischemia → ↑inflammatory mediators → rebound vasodilation → ↑ permeability & leak → inflammatory reaction → activates perivascular **nociceptive** nerves → It throbs as blood flow at these sensitive area with each heartbeat → migraine headache.

### 4 | Neurovascular theory

### 5 | Mediators [ Serotonin ]

**Triggers** → Release K / glutamates → Creates a slowly well-defined depolarizing wave → depolarize adjacent tissues → propagating at a rate of 2-6 mm/min → vasoconstriction → migraine aura → **activate trigemino-vascular complex** → **vasodilation** → migraine headache.

**Stimulation of the trigeminal nerve** causes the release of **vasoactive peptides** (e.g calcitonin , substance P , neurokinin A ) this is responsible for the head pain, as well as the facial and neck pain, experienced during migraine.

1. CNS diseases, destruction or dysfunction diseases.

# Treatment Strategy

- They reduce the recurrence frequency, severity, duration & / or disability.
  - increase responsiveness to abortive therapy.
- N.B. Full effect of therapy needs several weeks to manifest & should continue for 6 m. & can be repeated.

## A) Anti-epileptics:

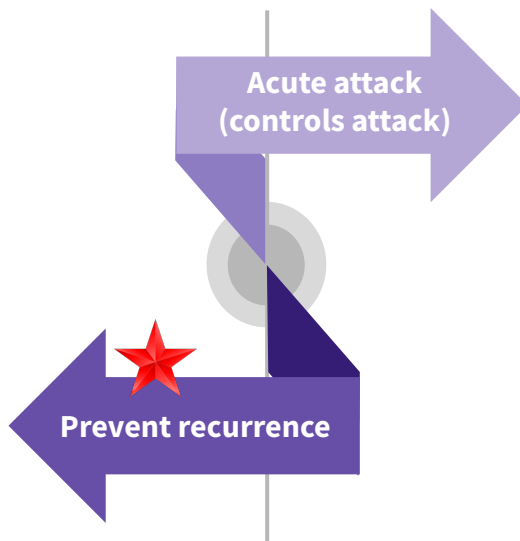

Block Na<sup>+</sup> channel & augment GABA at GABA-A receptors e.g **Topiramate, Valproic**

## B) Antidepressants:

TCA; **amitriptylin** and **nortriptyline**

## C) Antihypertensives:

- B-blockers; **propranolol**<sup>1</sup>
- Propranolol** is commonly used in **prophylaxis** of migraine attack.

## A) ABORTIVE therapy

(For severe- disabling pain)

- They **specifically target pathways of migraine** by reducing meningeal dilatation & reduces neural activation via 5HT<sub>1</sub> agonism i.e stopping headache as it its evolving.
- Abortive medication **effective if taken early, just before the pain starts**, losing effectiveness once the attack has begun. **So they must be rapidly acting.**

## B) RESCUE therapy<sup>2</sup>

(For mild to moderate pain)

- **Non-specifically**
- Target individual **symptoms**. i.e. Alleviating Pain, emesis and associated symptoms.

# Acute Attack

## Rescue Therapy

Class	Analgesic	Antiemetics
Drugs	<b>1- NSAIDs:</b> <ul style="list-style-type: none"> <li>• <b>Acetaminophen</b></li> <li>• <b>Aspirin</b> (weaker)</li> <li>• <b>Ibuprofen, Naproxen</b> → for <b>mild to moderate</b> attack with <b>no nausea &amp; vomiting</b>.</li> </ul>	<b>1- Dopamine Antagonists</b> <ul style="list-style-type: none"> <li>• <b>Domperidone</b><sup>4</sup> <b>Increases the Gastro-prokinetic:</b> ↑ Absorption<sup>5</sup> &amp; bioavailability of abortive therapy.</li> <li>• <b>Phenothiazines (Promethazine):</b> Has a <b>sedative</b> effect.</li> </ul>
	<b>2- Non-opioid</b> <sup>3</sup> μ (mu) agonist <ul style="list-style-type: none"> <li>• <b>tramadol</b> (Tramadol also inhibits serotonin reuptake)</li> </ul>	<b>2- 5HT<sub>3</sub> antagonists (for Chemotherapy)</b> <ul style="list-style-type: none"> <li>• <b>Ondansetron, Granisetron:</b> For <b>severe nausea and vomiting</b>.</li> </ul>
		<b>3- H<sub>1</sub> antagonist (not for drivers)</b> <ul style="list-style-type: none"> <li>• <b>Meclizine, diphenhydramine:</b> Has <b>anti-histaminic + sedative + Anti-cholinergic effects</b>.</li> </ul>

1- Gold standard

2- it not to treat the migraine, only for signs and symptoms.

3- when pain is severe

4- Migraine inhibit gastric emptying

5- by increase GIT motility

# Acute Attack

## Abortive Therapy : a) Ergots

Drugs	Ergotamine tartarate <small>rare clinical use due to severe adverse effects,restricted use</small>	Dihydroergotamine (DHE) <small>preferred in clinical setting</small>
MOA	<ul style="list-style-type: none"> <li>Product of <i>Claviceps purpurea</i>; a fungus growing on rye/grains</li> <li>★ <b>Non-Selective</b><sup>1</sup></li> <li>★ <b>Partial agonism at 5HT1 receptors</b> (5HT-1D/1B found in cerebral And meningeal vessels):               <ul style="list-style-type: none"> <li>○ ↓ release of vasodilating peptides</li> <li>○ ↓ excessive firing of nerve endings</li> <li>○ At blood vessels → ↓ vasodilation &amp; stretching of the pain endings</li> </ul> </li> <li>● <b>Partial agonist effect on α-adrenoceptors</b> → vasoconstriction (peripherally, not desirable)</li> </ul>	
P.K	<ul style="list-style-type: none"> <li>Oral absorption incomplete (erratic) + slow → low bioavailability.</li> <li>Can be taken orally (<b>Cafergot</b><sup>2</sup> is a formula which contains <u>caffeine</u> and <u>ergotamine</u>), sublingually, rectal suppository, inhaler.</li> <li>Despite T1/2 nearly 2 hours, <b>ergotamine</b> produces vasoconstriction → <b>24 hours</b> or longer due to <b>high and long tissue binding ability</b>.</li> <li>● <b>Ergotamine tartrate</b> has <b>significant side effects</b>, and may <b>worsen the nausea and vomiting associated with migraine</b>.</li> </ul>	<ul style="list-style-type: none"> <li>Nasal spray, inhaler &amp; <b>injectable forms</b> (good to use if patient is <b>vomiting</b>)</li> <li>● Given parenterally, and eliminated more rapidly than <b>ergotamine</b>, presumably due to its rapid hepatic clearance and has less adverse effects.</li> </ul>
Uses	<ul style="list-style-type: none"> <li>★ They are only used to abort the attacks (Except <b>Dihydroergotamine</b><sup>3</sup> can be given for severe, recurrent attacks <b>not</b> responding to other drugs)</li> <li>● Their use is <b>restricted</b> to patients with frequent, moderate attack or infrequent but severe attacks.</li> </ul>	
ADRs ★	<ul style="list-style-type: none"> <li>● GI upset</li> <li>● Feeling of cold and numbness of limbs, tingling<sup>4</sup></li> <li>★ <b>Anginal pain</b><sup>4</sup> due to <b>coronary spasm</b>, and disturbed cardiac rhythm (tachycardia or bradycardia)</li> <li>★ <b>Prolong use</b> → <b>rebound headache due to vasodilation</b> followed by <b>Vasoconstriction</b>.</li> <li>● Prolong use and high dose → paraesthesia (tingling or burning sensation)</li> </ul>	
C.I ★	<ul style="list-style-type: none"> <li>● Pregnancy; fetal distress and miscarriage (ergot is uterine stimulant and vasoconstrictor)</li> <li>● Peripheral and coronary vascular diseases</li> <li>● Hypertension</li> <li>● prophylaxis of migraine</li> <li>● Liver and kidney diseases<sup>5</sup></li> <li>● In concurrent use with <b>triptans</b> (given at least 6 hrs from last dose of triptans <b>or</b> 24 hrs from stopping ergotamine and B-blockers)<sup>6</sup></li> </ul>	

1. Non selective means that it act on many receptors such as : dopamine , alpha 1 and alpha 2 and serotonin receptors
2. This combination to improve sign and symptoms
3. We don't start with DHE , only use it when patient Not responding to other drugs
4. Due to vasoconstriction
5. Because they have ability to bind to tissue , so they stay in the body long time → their metabolism becomes longer
6. With B- blockers will cause reflex tachycardia

# Acute Attack

## Abortive Therapy : b) Triptanes

Drugs	Sumatriptan <sup>1</sup>	Zolmitriptan	Naratriptan
MOA	<ul style="list-style-type: none"> <li>● <b>Selective</b> Agonism at 5-HT<sub>1</sub> (5-HT<sub>1D/1B</sub>) receptors</li> <li>● Similar to ergotamine except that triptans are more selective as serotonergic agonist.</li> <li>★ <b>No α<sub>1</sub>, α<sub>2</sub>, β –adrenergic, dopamine or muscarinic receptors.</b></li> <li>● Triptans inhibit the release of vasoactive peptides, promote vasoconstriction, and block pain pathways in the brainstem.</li> <li>● Triptans inhibit transmission in the trigeminal nucleus caudalis</li> </ul>		
P.K	<p><b>Bioavailability:</b></p> <ul style="list-style-type: none"> <li>● Oral → low</li> <li>● <b>Subcutaneous → 97%, peaks after 2 min</b> &amp; T<sub>1/2</sub> nearly 2 hours (fast action with SC, <b>good for patient with vomiting</b>)</li> <li>● <b>Given oral, nasal spray, and injectable</b></li> </ul>	<ul style="list-style-type: none"> <li>● <b>Oral</b> bioavailability <b>40%</b>, peaks <u>after 2 hrs</u> &amp; T<sub>1/2</sub> nearly 3 hours.</li> <li>● <b>Given nasal spray, and injectable</b></li> </ul>	<ul style="list-style-type: none"> <li>● <b>Oral</b> bioavailability <b>70%</b>, peaks <u>after 2 hrs</u> &amp; T<sub>1/2</sub> nearly 6 hours (slower onset, <b>less side effects</b>)</li> <li>● <b>Given Oral preparations</b></li> </ul>
Uses	<ul style="list-style-type: none"> <li>● To abort attacks in patients with frequent, moderate or infrequent but <b>severe attacks.</b></li> <li>● In <b>cluster headache</b> “ <b>extremely painful migraine</b> “</li> </ul>		
ADRs	<ul style="list-style-type: none"> <li>● Most of ADRs are the same as with ergot <b>but triptans are better tolerated.</b><sup>2</sup></li> <li>● Mild pain and burning sensation at the site of injection.</li> <li>● Vasospasm, <b>Ischemic heart; Angina</b> and Arrhythmias</li> <li>★ <b>Zolmitriptan<sup>3</sup>: Chest &amp; neck tightness, Coronary vasospasm &amp; Somnolence</b></li> </ul>		
C.I	<ul style="list-style-type: none"> <li>● History of ischemia</li> <li>● Cerebrovascular disorders<sup>4</sup></li> <li>● Peripheral vasospastic diseases</li> <li>● Uncontrolled hypertension</li> <li>★ In concurrent use with <b>ergots</b> or others <b>inducing vasospasm</b></li> <li>★ In concurrent use with <b>MAOIs, lithium, SSRIs</b>, → (5HT increased to toxic level)</li> <li>● Renal or hepatic impairment</li> </ul>		

1- for emergency, part of rescue

2- less side effects

3- due its longer action

4- carotid aneurysm , stroke

# Deciding whether better with a triptans or with DHE

If the patient:

Has migraines a day or less and need rapid relief:

**Triptans are often a better choice**

Pregnant woman

paracetamol or **intranasal<sup>1</sup> sumatriptan** and or **diphenhydramine, meclizine** are **safe**.

With headache episodes lasting 2 or 3 days

**DHE is often the optimal choice** because it has longer **T<sub>1/2</sub>**

- The **form** of drug preparation could influence the choice
- **Injectable Sumatriptan** reaches T<sub>max</sub> the fastest followed by DHE nasal spray and Rizatriptan.

## Factors When Choosing a Triptans:

Drug	T <sub>max</sub>	T <sub>1/2</sub>
DHE	1	10
Sumatriptan SQ	0.25	2
Rizatriptan	1-1.5	2-3
Zolmitriptan	2.5	3
<b>Naratriptan</b>	2-3	6
<b>Eletriptan</b>	2.8	4
<b>Frovatriptan</b>	2-3	26

- **Differences** in the time to peak blood concentration **T<sub>max</sub>**, equates with faster relief of pain.
- **Differences** in **t<sub>1/2</sub>** → a clinical effect in terms of **recurrence** of headache.
- ★ For **extremely fast relief within 15 min. injectable Sumatriptan is the only choice.**
- ★ If expected **re-dosing is needed** & / or **recurrence of headache** → **Naratriptan, frovatriptan**, have slower onset, fewer side effects, and a lower recurrence rate.
- ★ **Menstrual migraine: Frovatriptan** (longer T<sub>1/2</sub>= 26hrs) 2.5 mg **twice** per day beginning **two days before** the anticipated onset of menstrual migraine and **continuing for six days.**

1- to not expose the patients to high doses, also it will reach CNS without reaching to the fetus.

# Quiz

## MCQ

1- Which of the following drugs for headache is contraindicated in patients with peripheral vascular disease?

A- Ergotamine B- Aspirin C- Naproxen D- Ibuprofen

2- A patient with a moderate headache with no nausea or vomiting which drug would you prescribe?

A- Zolmitriptan B- Ergotamine C- Amitriptyline D- Naproxen

3- Which of the following drugs causes rebound headaches with prolonged use?

A- Dihydroergotamine B- Propranolol C- Aspirin D- Sumatriptan

4- Which of the following drugs acts as a central analgesic?

A- Propranolol B- Aspirin C- Tramadol D- Ibuprofen

## SAQ

-A 26-years-old pregnant female came to the ER suffering from migraine for less a day, she said that she can't handle the pain more and asked for a rapid relief drug.

1- Which drug would be the most appropriate in this situation?

2- What is the mechanism of action of that drug?

3- List other drugs that are safe for pregnant women having migraine.

-Nasser is 31-years-old male came to the ER with a history of recurrent severe headache attacks for 2 days and he mentioned that he took paracetamol two times but it wasn't helpful.

4- Which drug would be the most appropriate to this patient ?

5- Mention 3 ADR of this drug,

### MCQ

Q1	A
Q2	D
Q3	A
Q4	C

### SAQ

Q1	sumatriptan
Q2	Selective Agonist at 5-HT <sub>1</sub> (5-HT <sub>1D</sub> /1B) receptors
Q3	paracetamol, diphenhydramine, meclizine
Q4	Dihydroergotamine (DHE)
Q5	Anginal pain & disturbed cardiac rhythm - Rebound headache (Prolong use) - Paraesthesia (Prolong & high dose)

**Answers:**

**pharmacology**
