ANTIMALARIAL DRUGS

ILOS

⊙ Classify the main antimalarial drugs depending on their goal of therapy

⊙ Detail the pharmacokinetics & dynamics of main drugs used to **treat** attack or **prevent** relapses

⊙ State the **WHO** therapeutic strategy for treatment

⊙ Hint on the **CDC** recommendations for prophylaxis in travelers to endemic areas.

According to WHO:

212 million cases of malaria worldwide in 2015 & 429,000 deaths.

90% of malaria cases & deaths occur in **Africa**.

Children under 5 are most at risk.

Four species of plasmodium typically cause human malaria:

- *Plasmodium falciparum*,
- *P vivax*,
- *P malariae*, and
- *P ovale*.

NOBEL PRIZE IN MEDICINE 2015

The Nobel Prize in Physiology or Medicine 2015 was awarded with one half jointly to **William C. Campbell & Satoshi Omura** & the other half to **Youyou Tu**.

Youyou Tu is the first China-based scientist to win a Nobel Prize.

An ancient Chinese herbal remedy led to the isolation of artemisinin.

AVERMECTINS

A class of compounds, discovered by Omura and Campbell, that kill roundworms, parasites that cause diseases such as river blindness.

ARTEMISININ

An antimalarial drug discovered by Tu in the 1970s. It was derived from the wormwood plant, after a search of herbal remedies to find antimalarial drugs.

PHARMAKOKINETICS

⊙ Rapidly biotransformed in liver into di-hydroartemesinin → active metabolite

⊙ Artemisinin, artesunate, artemether are **prodrugs**

⊙ Derivatives are rapidly absorbed orally & Widely distributed

Artemisinin $t_{1/2}$ → 4 hrs

⊙ **Artesunate** $t_{1/2}$ 45 min (water-soluble; oral, IV, IM, rectal administration)

⊙ Artemether $t_{1/2}$ 4-11 hrs, (lipid-soluble; oral, IM, & rectal administration). Induce its own CYP-mediated metabolism → ↑ clearance 5 fold.

ARTEMESININ & ITS DERIVATIVES

MECHANISM

Artemisinin & its analogs are very rapidly acting blood schizonticides against all human malaria parasites. No effect on hepatic stages.

ARTEMESININ & ITS DERIVATIVES

MECHANISM

They have endoperoxide bridges
Haem iron cleaves this bridge to yield carbon-centered free radicals in parasite, that will →

⊗ Alkylate membranes of parasite's **food vacuole** & mitochondria → no energy

⊗ Irreversibly bind & inhibit sarco-endoplasmic reticulum **Ca²⁺-ATPase** of the parasite, thereby inhibiting its growth

⊗ Inhibiting formation of **transport vesicles** → no food vacuoles.

Haeme interacts with Endoperoxide bridge in artemisinin

Releases free radicals

Binds with membrane protein

Causes lipid peroxidation

Damages ER

Inhibits protein synthesis

Lysis in the parasite

ARTEMESININ

CLINICAL USES

Because **artemisinin derivatives** have short $t_{1/2}$,

- (1) Monotherapy should be extended beyond disappearance of parasite to prevent recrudescence or
- (2) by combining the drug with long-acting antimalarial drugs (Ex. mefloquine)

PREPARATIONS

Artesunate IV or IM preparations for severe complicated cases as cerebral malaria (24 h) followed by complete course of ACT.

ARTEMESININ

ANTIMALARIAL DRUGS

CHLOROQUINE

Potent **blood** Schizontocide

Active against all forms of the schizonts (exception is chloroquine-resistant *P.f.* & *P.v.*)

Not active against tissue schizonts

Gametocide:-Against all species except *P. falciparum*.

CHLOROQUINE

PHARMACOKINETICS

- ⊙ Rapidly & completely absorbed from the GIT, given po
- ⊙ Has high volume of distribution (100-1000 L/kg); Released slowly from tissues & metabolized in liver

Concentrated into parasitized RBCs

- ⊙ Excreted in the urine 70% unchanged
- ⊙ Initial $t_{1/2}$ = 2-3 days & terminal elimination $t_{1/2}$ = 1-2 months.

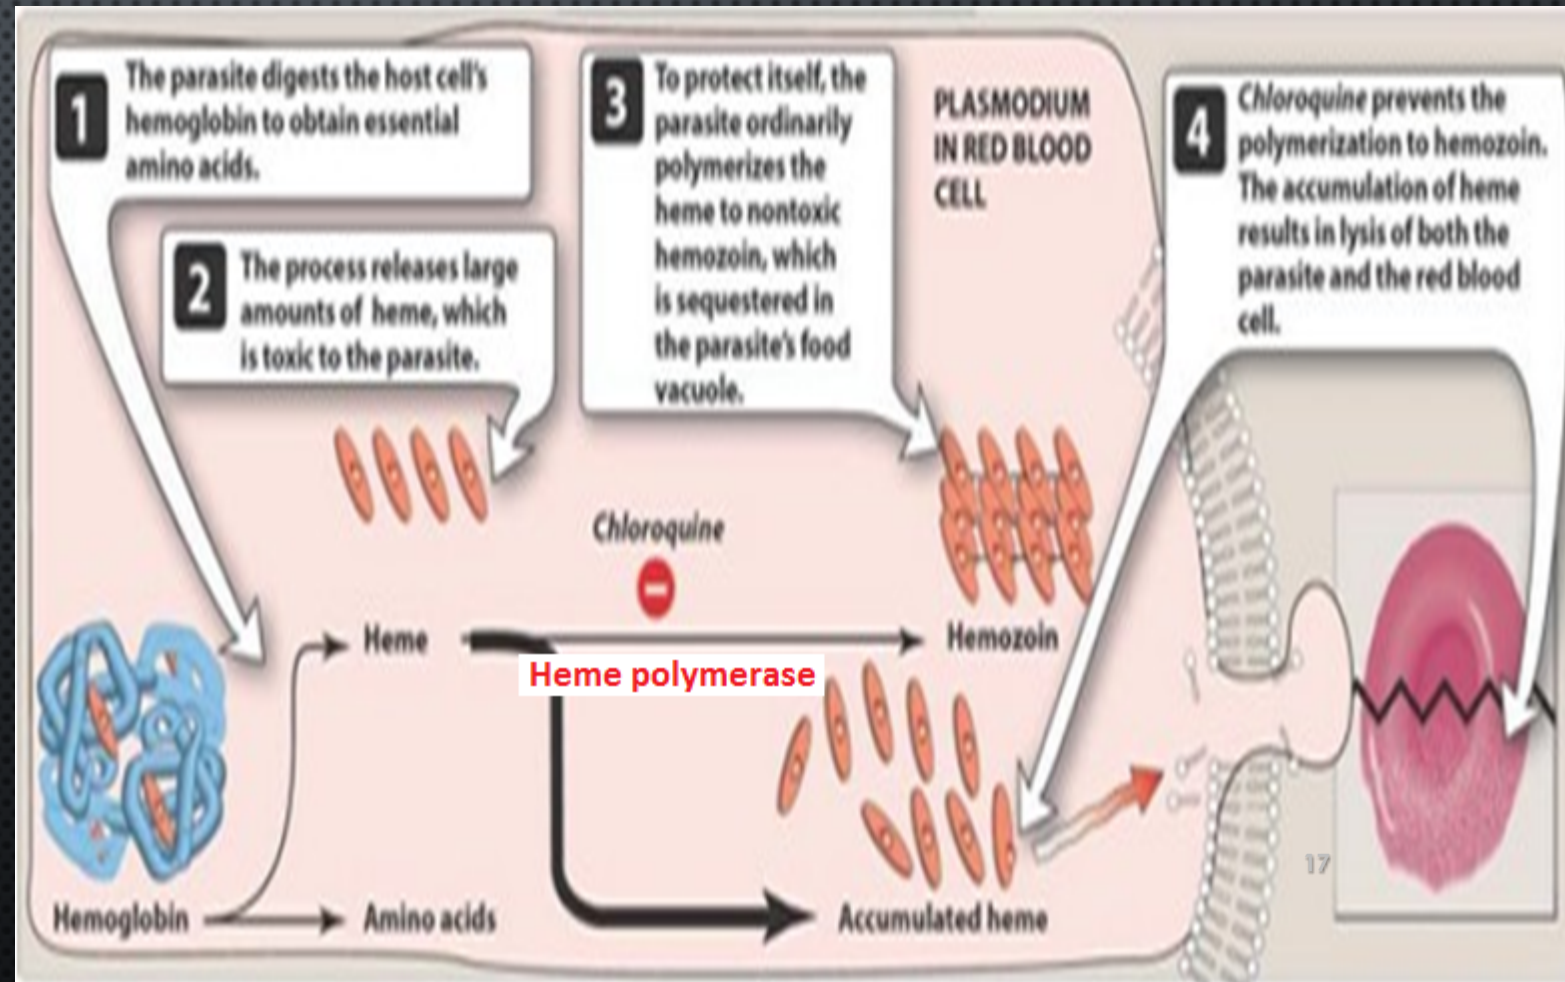

CHLOROQUINE

MECHANISM OF ACTION

Malaria Parasite digest host cell's Hb to utilize globin & obtain amino acids

Heme is released → Toxic
So parasite detoxifies it by *heme polymerase* → Hemozoin (NonToxic) & traps it in food vacuoles.

CHLOROQUINE

RESISTANCE

Resistance against the drug develops as a result of mutation of the chloroquine resistance transporter (PfCRT)

PfCRT enhances the efflux of chloroquine from the food vacuole.

CHLOROQUINE

THERAPEUTIC USES

Used to eradicate **blood** schizonts of *Plasmodium*. It is given in loading dose to rapidly achieve effective plasma conc.

Hepatic amebiasis

Rheumatoid arthritis.
