

*Use of Insulin in the treatment
of diabetes mellitus*

Prof. Hanan Hagar

Objectives:

by the end of this lecture, students should be able to:

- *Define diabetes and mention different types of diabetes*
- *Differentiate between difference in treating type I and type II diabetes.*
- *Understand mechanism of action, secretion, and actions of insulin.*
- *Describe different types of insulin analogues*
- *Be able to recognize the difference in pharmacokinetic profile between different types of insulin analogues.*
- *Know uses of different insulin analogues*

Diabetes mellitus

- Is a **chronic metabolic disorder** characterized by high blood glucose level caused by caused by deficiency of insulin or by increased insulin resistance.

Diabetes mellitus

Fasting plasma glucose (no food for 8 hrs)

Normal <100 mg/dl (5.6 mmol/l).

Pre-diabetes 100-125 mg/dl (5.6-6.9 mmol/L).

Diabetes if

Fasting >126 mg/dl (7 mmol/L)

or 2h after a meal > 200 mg/dl (11.1 mmol/L).

Types of diabetes

- **Type I diabetes (IDDM)**
due to autoimmune or viral diseases
- **Type II diabetes (NIDDM)**
due to genetic susceptibility and other factors (age, obesity).

Type I Diabetes

IDDM

- **10-20% occurrence.**
- **During childhood or puberty**
- **β -cells are completely destroyed.**
- **Absolute deficiency of insulin secretion**
- **Treated by insulin.**

Type II Diabetes

NIDDM

- **80-90% occurrence**
- **Over age 35**
- **Pancreatic β -cells are not producing enough insulin**
- **Obesity** is an important factor.
- **Insulin resistance** in peripheral tissues.
- Treated by **oral hypoglycemic drugs.**

| Characteristic | Type 1 | Type 2 |
|------------------------------------|--|--|
| Onset (Age) | Usually during childhood or puberty | Usually over age 40 |
| Type of onset | Abrupt | Gradual |
| Prevalence | 10-20% | 80-90 % |
| Genetic predisposition | Moderate | Very strong |
| Defects | β-cells are destroyed | β-cells produce inadequate quantity of insulin |
| Endogenous insulin | Absent | Present (not enough) |
| Insulin resistance | absent | present |
| Nutritional status | Usually thin | Usually obese |
| Ketosis | Frequent | Usually absent |
| Clinical symptoms | Polydipsia, polyphagia, polyuria, weight loss | Often asymptomatic |
| Related lipid abnormalities | Hypercholesterolemia frequent | Cholesterol & triglycerides often elevated |
| Treatment | Insulin injection | Oral hypoglycemic drugs |

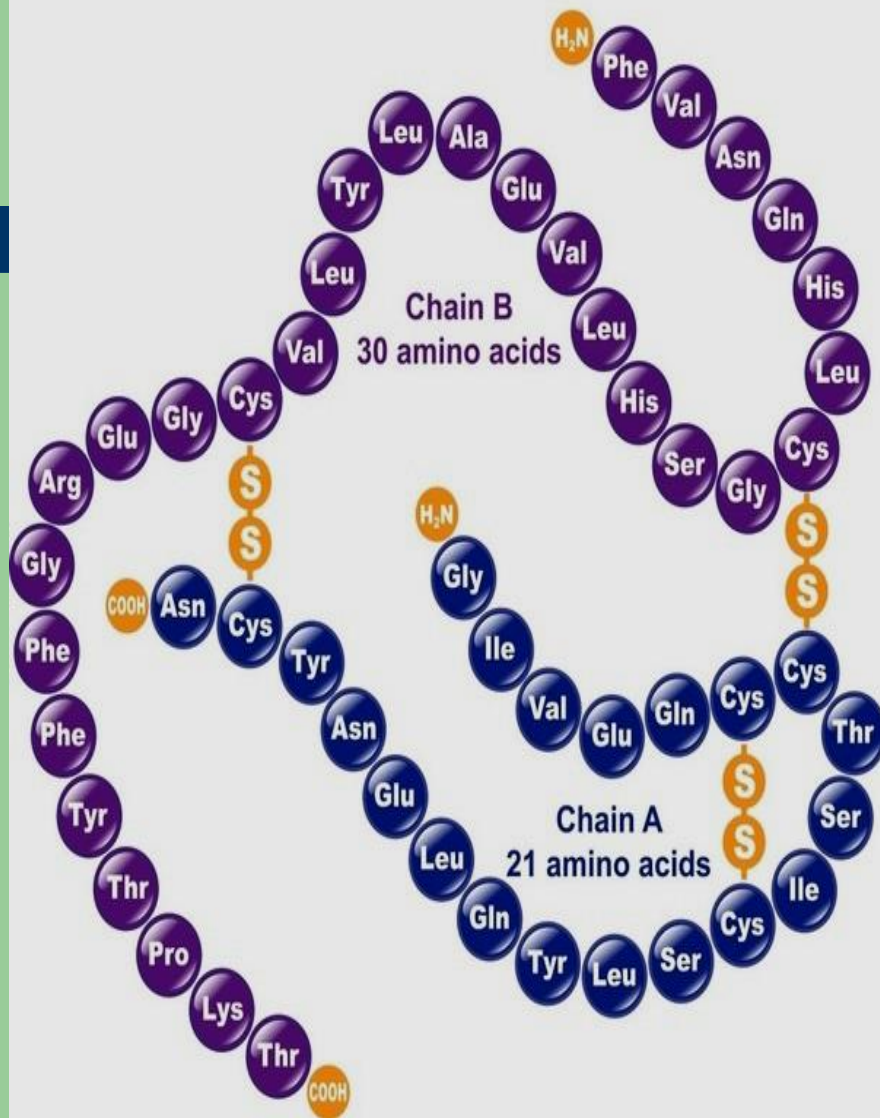

Complications of diabetes

- **Cardiovascular problems**
 - **Micro- and macro-vascular disease**
- **Renal failure (nephropathy).**
- **Blindness (retinopathy).**
- **Neuropathy.**
- **Risk of foot amputation**

A decorative graphic in the top-left corner consisting of a light green square and a dark blue rounded rectangle.

INSULIN

Human Insulin

Insulin receptors

- Present on cell membranes of most tissues.**
- Liver, muscle and adipose tissue**

Effects of insulin

I. Carbohydrate Metabolism:

- ↑ glucose uptake & utilization by peripheral tissues.
- ↑ Glycogen synthesis (**glycogen synthase**)
- ↑ Conversion of carbohydrate to fats.
- ↓ Gluconeogenesis.
- ↓ Glycogenolysis (liver).
- ↑ Glycolysis (muscle).

II. Fat Metabolism:

- **Liver:**

- ↑ **Lipogenesis.**
- ↓ **Lipolysis.**
- **Inhibits conversion of fatty acids to keto acids.**

- **Adipose Tissue:**

- ↑ **Triglycerides storage.**
- ↑ **Fatty acids synthesis.**
- ↓ **Lipolysis**

III. Protein Metabolism:

Liver:

- ↓ protein catabolism.

Muscle:

- ↑ amino acids uptake.
- ↑ protein synthesis.
- ↑ glycogen synthesis (**glycogenesis**).

IV. potassium

- **↑ potassium uptake into cells.**

Routes of administrations of exogenous insulin

- **Can not be given orally (why ?)**
- **Insulin syringes (s.c., arms, abdomen, thighs).**
- **Portable pin injector (pre-filled).**
- **Continuous S.C. infusion (insulin pump).**
 - **More convenient**
 - **Eliminate multiple daily injection**
 - **Programmed to deliver basal rate of insulin.**

Routes of administrations of exogenous insulin

- **Intravenously (in a hyperglycemic emergency)**

Under Clinical Trials

- **Inhaled aerosols, transdermal, intranasal.**

Pin injector

Insulin pump

Insulin degradation

1. Basal level of endogenous insulin is 5-15 $\mu\text{U/ml}$.
2. Half life of circulating insulin is 3-5 min.
3. 60% liver & 40% kidney (**endogenous insulin**)
4. 60% kidney & 40% liver (**exogenous insulin**)

Sources of Exogenous Insulin

- **Beef Insulin**
 - Differs from human insulin by 3 amino acids (antigenic).
- **Porcine Insulin**
 - Differs by one amino acid (antigenic).

Human Insulin analogues

- **Prepared by recombinant DNA techniques.**
- **Less immunogenic.**
- **Modifications of amino acid sequence of human insulin can change pharmacokinetics.**

Types of insulin preparations

Differ in pharmacokinetic properties mainly

- Onset of action (Rate of absorption).
- Duration of action.

Variation is due to:

- Change of amino acid sequence.
- Size and composition of insulin crystals in preparations (monomers, dimers, hexamers).

Types of insulin preparations

Insulin Analogues

- **Ultra-short acting insulins**
e.g. Lispro, aspart
very fast onset of action and short duration
- **Short acting insulins**
e.g. regular insulin e.g. Humulin R
fast onset of action and short duration.

Types of insulin preparations

- **Intermediate acting insulins**
 - **e.g. NPH, lente**
 - **Slow onset, intermediate duration of action.**
- **Long acting insulins**
 - **e.g. glargine, detemir**
 - **Slow onset and long duration of action.**

Ultra-short acting insulins

Insulin lispro, insulin aspart

- **Clear** solutions at neutral pH.
- Do not aggregate or form dimers or hexamers (**monomeric analogue**).
- **Fast onset** of action (5-15 min)
- S.C. (5 -15 min before meal).
- **Short duration** of action (3-5 h)

Ultra-short acting insulins

Insulin Lispro, insulin aspart

- **Reach peak level 30-90 min after injection.**
- **3 times/day.**
- **Mimic the prandial mealtime insulin release.**
- **I.V. in emergency.**

Insulin aspart

Structure

Ultra-short acting insulins

Ultra-short acting insulins

insulin lispro, insulin aspart

- **Preferred for external insulin pump**
- **used to control post-prandial hyperglycemia (s.c.) and emergency diabetic ketoacidosis (i.v).**

Short acting insulins (Regular insulin)

- **Soluble** crystalline zinc insulin
- **Clear** solutions at neutral pH.
- **Forms hexamers.**
- **Onset of action 30-45 min (s.c.).**
- **I.V.** in emergency situations.
- **Peak 2-4 h.**
- **Duration 6-8 h.**

Short acting insulins (regular insulin)

- **2-3 times/day.**
- **Control postprandial hyperglycemia (s.c.) & emergency diabetic ketoacidosis (i.v.).**
- **Can be used in pregnancy**

| | |
|---|---|
| | Ultra-Short acting insulins e.g. Lispro, aspart, glulisine |
| Physical characteristics | Clear solution at neutral pH |
| chemistry | Monomeric analogue |
| Route & time of administration | S.C. 5 min (no more than 15 min) before meal I.V. in emergency (e.g. diabetic ketoacidosis) |
| Onset of action | Fast 5 – 15 min (S.C) |
| Peak level | 30 – 90 min |
| Duration | 3 – 5 hr Shorter |
| Usual administration | 2 – 3 times/day |
| | postprandial hyperglycemia & emergency diabetic ketoacidosis |

| | |
|--|---|
| | Short-acting (regular) insulins e.g. Humulin R, Novolin R |
| | Clear solution at neutral pH |
| | Hexameric analogue |
| | S.C. 30 – 45 min before meal I.V. in emergency (e.g. diabetic ketoacidosis) |
| | rapid 30 – 45 min (S.C) |
| | 2 – 4 hr |
| | 6 – 8 hr longer |
| | 2 – 3 times / day |
| | postprandial hyperglycemia & emergency diabetic ketoacidosis |

Advantages of Ultra-short vs Short Insulin

- **Rapid onset of action (patients will not wait long before they eat).**
- **Its duration of action is no longer than 3-4 hrs regardless of the dose:**
 - **Decreased risk of hyper insulinemia.**
 - **Decreased risk of postprandial hypoglycemia**

Intermediate acting insulins

Isophane (NPH) insulin

Lente insulin

Isophane (NPH) Insulin

- **NPH**, is a **Neutral Protamine Hagedorn** insulin in phosphate buffer.
- **NPH insulin** is combination of protamine & crystalline zinc insulin (1: 6 molecules).
proteolysis release insulin.

Isophane (NPH) Insulin

- **Turbid suspension** at neutral pH.
- **Given S.C. only not i.v.**
- **Can not be used in ketoacidosis or emergency**
- **Onset of action 1-2 h.**
- **Peak serum level 5-7 h.**
- **Duration of action 13-18 h.**

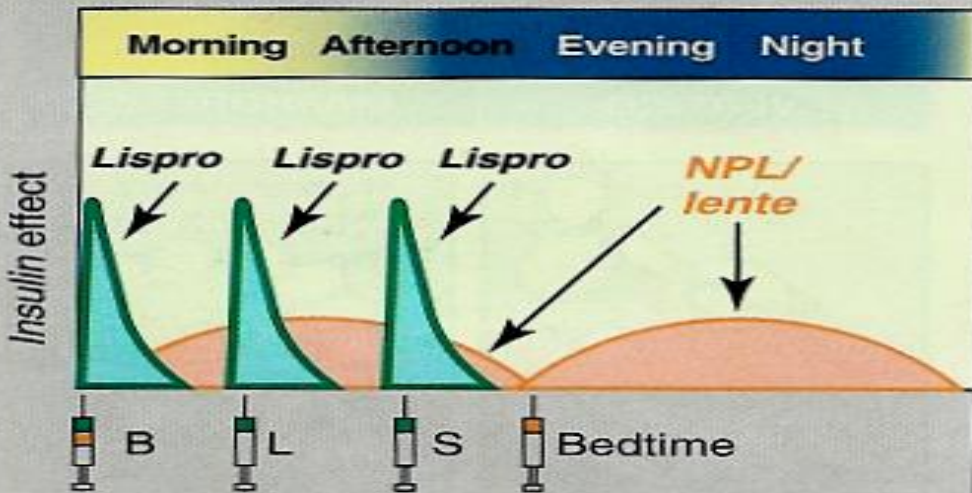

Isophane (NPH) Insulin

Insulin mixtures

- **NPH/regular insulin**
 - **75/25 , 70/30 , 50/50**
- **(NPL= NPH / lispro) (NPA= NPH / aspart)**
- **NPL & NPA have the same duration as NPH**
- **Have two peaks.**

A

Prandial and basal insulin replacement

B

Lente insulin

- **Mixture of:**
 - **30% semilente insulin (amorphous precipitate of zinc insulin in acetate buffer)**
 - **70% ultralente insulin (poorly soluble crystal of zinc insulin)**
- **Turbid suspension at neutral pH**
- **Given S.C., not intravenously**

Lente insulin (Humulin L, Novolin L)

- **Delayed onset of action (1-3 h)**
- **Peak serum level 4-8 h.**
- **Duration of action 13-20 h.**
- **Lente and NPH insulins are equivalent in activity.**
- **Lente is not used in diabetic ketoacidosis or emergency.**

Long acting insulins

Insulin glargine (lantus), Insulin detemir (Levemir)

Insulin glargine (Lantus)

- Clear solution **BUT** forms precipitate (hexamer) at injection site.
- Slow onset of action 2 h.
- absorbed less rapidly than NPH & Lente insulin.
- Given s.c., **not intravenously**
- Should not be mixed with other insulins in the same syringe.

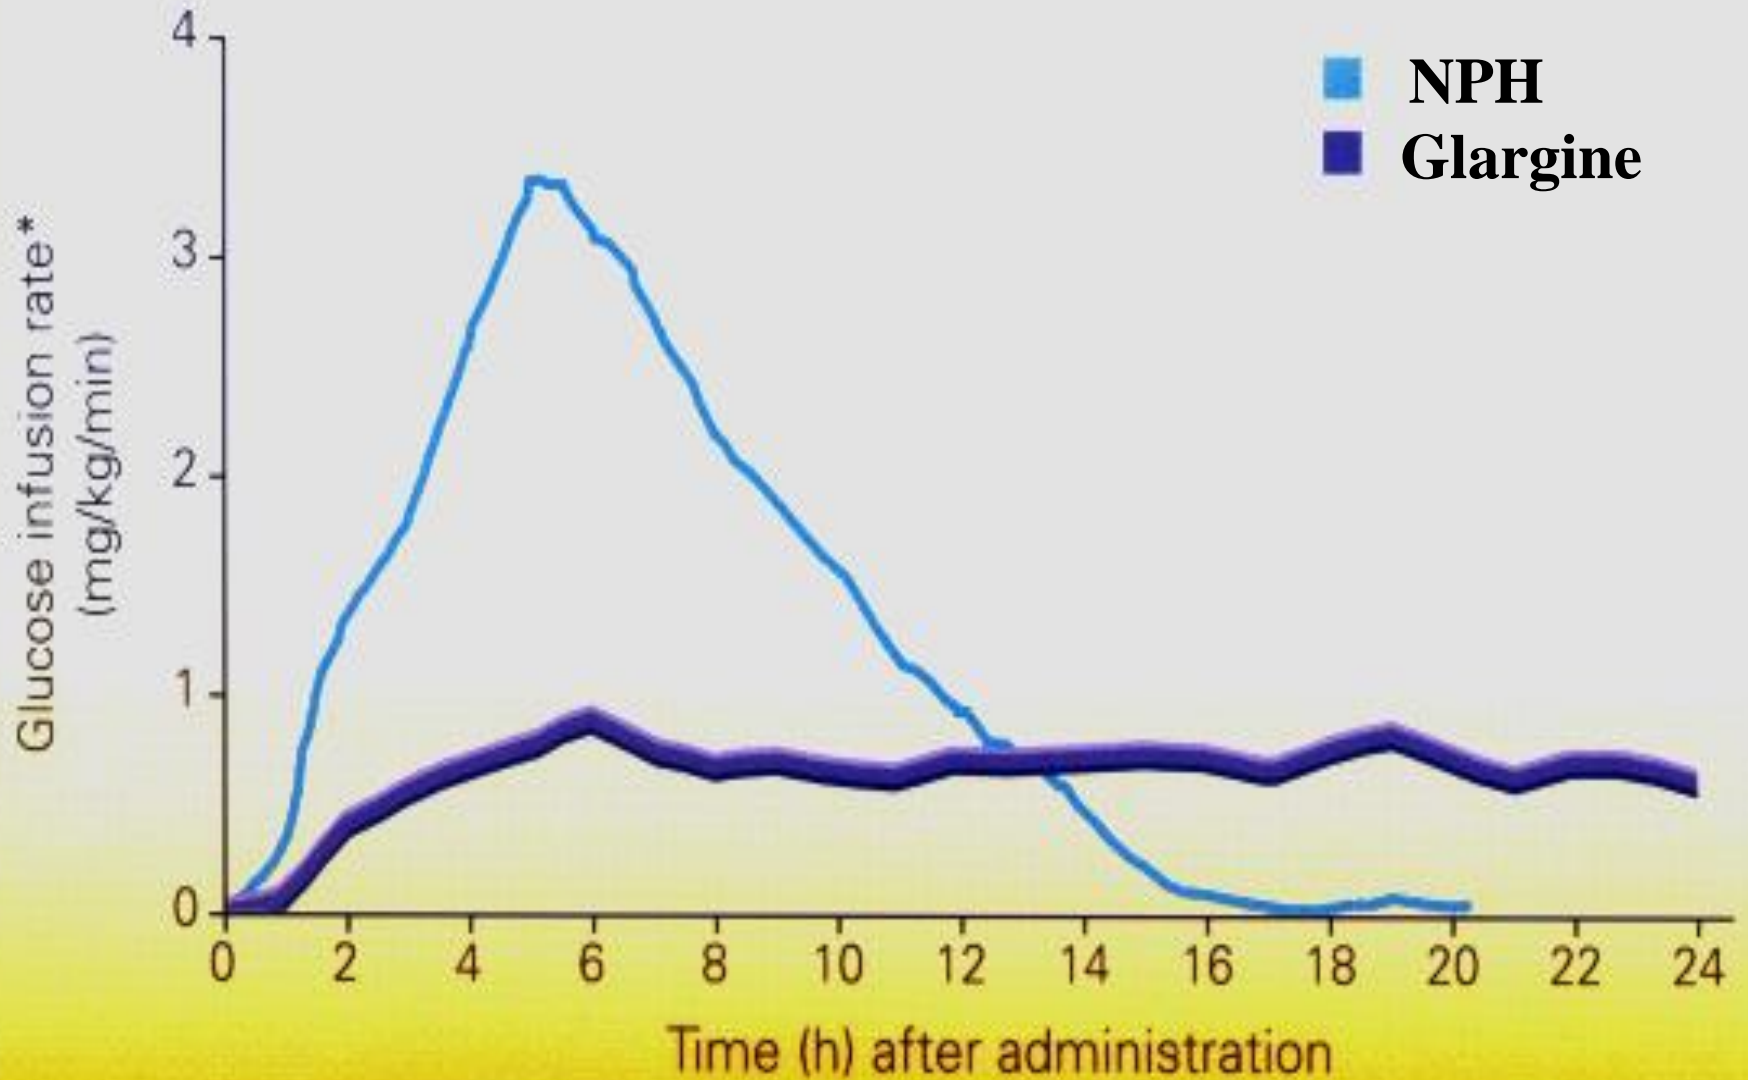

Insulin glargine (Lantus)

- **Maximum effect after 4-5 h**
- **Prolonged duration of action (24 h).**
- **Once daily**
- **produce broad plasma concentration plateau (low continuous insulin level).**
- **Glargine must be used in regimens with rapid or short acting insulins.**

Advantages over intermediate-acting insulins:

- **Constant circulating insulin over 24 hr with no peak (**peakless profile**).**
- **Produce flat prolonged hypoglycemic effect.**
- **Safer than NPH & Lente insulins**
(reduced risk of nocturnal hypoglycemia).

NPH vs Glargine

Insulin preparations

Insulin Dosing considerations

- **Blood glucose monitoring is required in all patients receiving insulin**
- **Rotate injection sites within the same region.**
- **Insulin should be stored in refrigerator and warm up to room temp before use.**

Complications of Insulin Therapy:

- Hypoglycemia
- Hypersensitivity reactions.
- Lipodystrophy (a buildup of fatty tissue) at the injection sites.
- Weight gain (due to anabolic effects of insulin)
- Insulin resistance
- Hypokalemia

Summary

- Insulin analogues are used to treat type I diabetes.
- *Fast acting insulins (lispro, aspart)*, given s.c. or i.v., produce fast action, used to mimic postprandial insulin.
- *Short acting insulin (Regular insulin)*, given s.c. or i.v. produce rapid action, used to mimic postprandial insulin.
- *Intermediate acting insulin (lente, Isophane)* produce slower action, than regular insulin, given s.c. not i.v.
- *Long acting insulins (glargine, detemir)* produce constant circulating insulin over 24 hr with no peak (peakless profile), s.c. not i.v.
