Reproductive Physiology

Puberty in males and females

Reproductive Block 2020

Objectives

By the end of this lecture, you should be able to:

- Recognize the onset of puberty related to changes in hypothalamic-pituitary-gonadal axis
- Explain the hormonal and physical changes that occur at puberty in boys and girls
- Recognize the influencing factors leading to puberty
- Describe the pathological disorders associated with puberty

PUBERTY

 Definition: Physiological transition from <u>childhood</u> (<u>juvenile</u>) to <u>adulthood</u>.

Characteristics of puberty:

- HPG axis matures.
- The primary sexual organs mature (gonads).
- The secondary sexual characteristics develop.
- The adolescent experiences the adolescent growth spurt.
- The adolescent achieves the ability to procreate.

Pulsatile secretion of GnRH

Increased sensitivity of the GnRH receptors in anterior pituitary

Pulsatile secretion of LH and FSH

Appearance of large **nocturnal pulses** of LH during REM sleep.

Maturation of *primary sexual characteristics* (gonads)

Secretion of gonadal steroid hormones testosterone and estradiol

Appearance of the secondary sex characteristics at puberty

Puberty

Appearance of secondary sexual characteristics (pubic and axillary hair, female breast development, male voice changes,...)

- Menstruation and spermatogenesis begin
 - Occurs between 8 and 14yrs in girls
 - Occurs between 9 and 14yrs in boys

Puberty – Terms & Events

- Thelarche: development of breast
- Pubarche development of pubic & axillary hair
- Menarche: the first menstrual period
- Adrenarche: the onset of an increase in the secretion of androgens; responsible for the development of pubic/axillary hair, body odour and acne.
- Gonadarche: maturation of gonadal function

Puberty – hormonal changes

- In young children, increased sensitivity of GnRH receptors to low gonadotropins <u>cannot</u> initiate gonadal function
- Between 9-12 yrs, blood levels of LH, FSH increase.
- High levels of LH, FSH initiate gonadal development
 - Nocturnal GnRH pulsatility (LH secretion) precedes phenotypic changes by several years
 - First phenotypic changes: breast development / testicular enlargement

Puberty – hormonal changes **HYPOTHALAMUS GnRH, GHRH, CRH, TRH ANTERIOR PITUITARY** LH & FSH **TSH ACTH HORMONE GROWTH HORMONE HORMONE TESTIS/ OVARY Thyroid gland Adrenal cortex LIVER SEX STEROID SYNTHESIS Thyroid Cortisol** IGF-1 **Androgens SEXUAL MATURATION SOMATIC TISSUE GROWTH GROWTH**

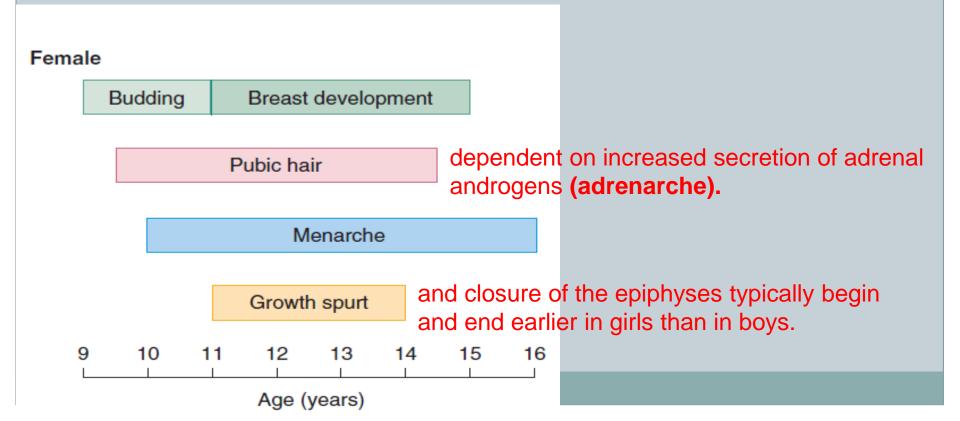

Physical Changes during puberty

Physical Changes

- 5 stages from childhood to full maturity
- Tanner Scale (1 − 5)
- Reflect progression in changes of the external genitalia/breast and pubic hair
- Secondary sexual characteristics
 - Mean age 11yrs in girls
 - Mean age 11.5 12yrs in boys

Puberty: Girls

- Thelarche is usually the first sign in most girls.
- Menarche usually occurs 2-3 yrs after Thelarche.

Puberty: Boys

- Puberty is associated with activation of the HPG axis.
- ➤ Leydig cell proliferation in the testes, and increased synthesis and secretion of testosterone.
- ➤ There is growth of the testes, largely because of an increased number of seminiferous tubules.
- > There is growth of the sex accessory organs such as the prostate.
- > There is a pronounced linear growth spurt.
- As plasma levels of testosterone increase, facial, pubic, and axillary hair appears and there is growth of the penis, lowering of the voice, and initiation of spermatogenesis (spermarche).

	Physical development (Girls)	Stage	Physical development (Boys)
B1	(Prepubertal). No glandular breast tissue palpable. Just	G1	(Prepubertal).Testicular volume < 3 mL. No pubic
PH1	an elevation of breast papilla. No pubic hair.	PH1	hair.
B2	Breast budding with elevation of breast and papilla as a	G2	Enlargement of testicular volume (3-6 mL) [1st
PH2	small mound [1 st pubertal sign in girls]. Downy soft pubic hair.	PH2	pubertal sign in boys]. Little or no change in penile size. Downy soft pubic hair.
	Growth spurt (between stage 2-3)		
В3	Further enlargement of breast and areola. Darker,	G3	Testicular volume 8-12 mL. Penile lengthening.
РН3	coarser and curled hair.	PH3	Darker, coarser, and curled hair.
1113		1113	Growth spurt (between stage 3-4)
B4	Projection of areola and papilla to form a "double	G4	Testicular volume 12-15 mL. Penile lengthening
DIIA	mound" above the level of the breast. More dense hair	DIIA	and broadening. Terminal hair that fills the entire
PH4	that fills the entire triangle overlying the pubic region	PH4	triangle overlying the pubic region and external
	and external genitalia and no spread to the inner thigh.		genitalia and no spread to the inner thigh.
	Menarche (between stage 4-5)		
B5	Mature breast. Loss of double mound due to the	G5	Testicular volume > 15 mL. Adult genitalia.
D115	projection of papilla only and recession of the areola to	D115	Terminal hair that extends beyond the inguinal
PH5	the level of the breast. Dense hair that extends beyond	PH5	area onto the inner thigh.
	the inguinal area onto the inner thigh.		

Puberty

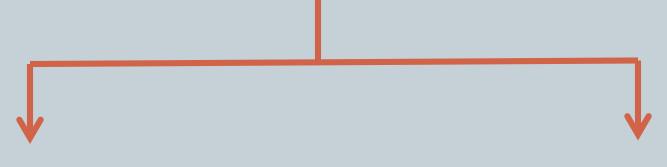

- Puberty is usually completed within 3 4 yrs of onset.
- Timing of puberty describes how mature a child is relative to his/her peers at the same age and sex (early, on time, or delayed).
- Tempo describes how quickly or slowly a child progresses throughout the stages of puberty to the complete development (slow, average, or fast).

Influencing Factors

- Genetic factors: 50-80% of variation in pubertal timing.
- Environmental factors: (Geographical differences, psychosocial stresses, endocrine disruptors from pollutants, and exposure to chemical and industrial compounds).
- Malnutrition and strenuous physical activity: delays puberty.
- Obesity
 — e.g. Leptin hormone regulates appetite and metabolism through hypothalamus. Permissive role in regulating the timing of puberty.

Disorders of Puberty

Early(precocious) Puberty

Delayed Puberty

Early (Precocious) Puberty

Precocious puberty refers to early pubertal development, often <u>before</u> 8 years of age in <u>girls</u> and <u>before</u> 9 years of age in <u>boys</u>.

PRECOCIOUS PUBERTY

(1) <u>Central Precocious Puberty</u> [Gonadotropin-dependent]

- Idiopathic central precocious puberty
- CNS tumours
- CNS congenital abnormalities
- Infectious or post-infectious conditions of hypothalamus

(2) Pseudoprecocious (Peripheral) Puberty [Gonadotropin-independent]

- Congenital adrenal hyperplasia (CAH)
- Gonads or adrenal gland tumours
- FSH and LH are suppressed
- No spermatogenesis or ovarian development

Delayed PUBERTY

Initial physical changes of puberty are not present

- by age 13 years in girls (or primary amenorrhea at 15.5-16y)
- by age 14 years in boys

Pubertal development is inappropriate

- The interval between first signs of puberty and menarche in girls, completion of genital growth in boys is > 5 years

DELAYED

PUBERTY

(1) Gonadal Failure

Hypergonadotropic hypogonadism:

- Klinefelter & Turner syndromes
- Chemo/radio therapies
- Congenital gonadal dysgenesis or Cryptorchidism
- FSH, LH and androgen receptor gene mutations
- Gonadal damage secondary to trauma, tumours, surgical removal, and infectious or autoimmune diseases.

(2) Gonadal Deficiency

Hypogonadotropic hypogonadism:

- Idiopathic
- FSH and LH gene mutations from pituitary gonadotropes
- Low FSH and LH levels
- CNS congenital anomalies and panhypopituitarism

The End

Thank You
