GEREBRUM

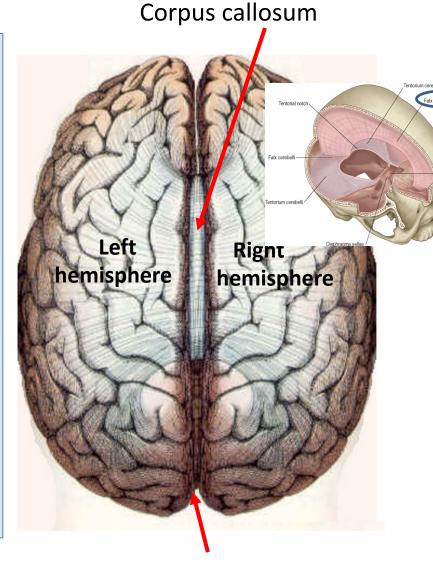

Objectives

At the end of the lecture, the student should be able to:

- List the parts of the cerebral hemisphere (cortex, medulla, basal nuclei, lateral ventricle).
- > Describe the subdivision of a cerebral hemisphere into lobes.
- List the important sulci and gyri of each lobe.
- Describe different types of fibers in cerebral medulla (association, projection and commissural) and give example of each type.

Cerebrum

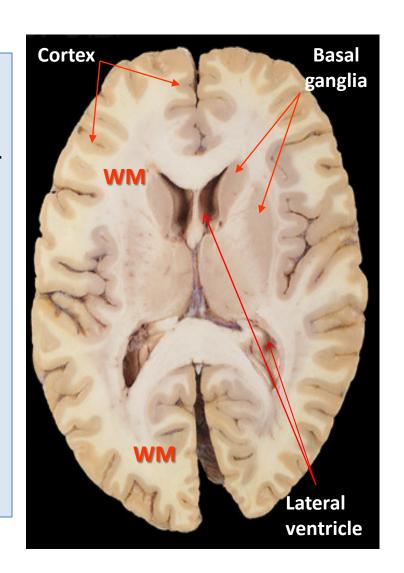

- > Largest part of the forebrain.
- Divided into two halves, the (cerebral hemipheres), which are separated by a deep median longitudinal fissure which lodges the falx cerebri.
- In the depth of the fissure, the hemispheres are connected by a bundle of fibers called the **corpus** callosum.

Median longitudinal fissure

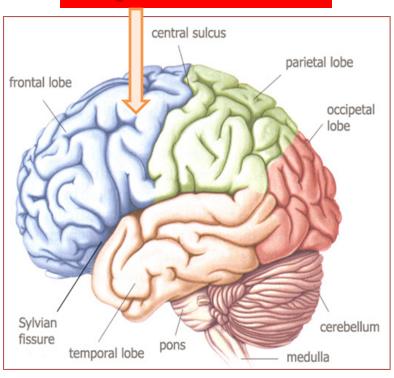

Structure of Cerebrum

- ☐ Cerebral cortex: Superficial layer of grey matter
- Medulla (White matter): Deeper to the cortex, contains axons to and from the cells of the cortex
- Basal ganglia: Number of nuclear masses buried within the white matter
- ☐ Lateral ventricle: The cavity of hemisphere

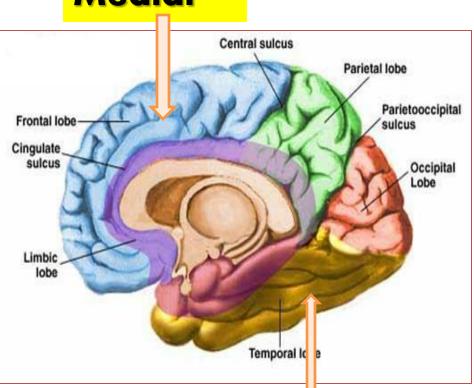

Surfaces(3)

Superolateral

Medial

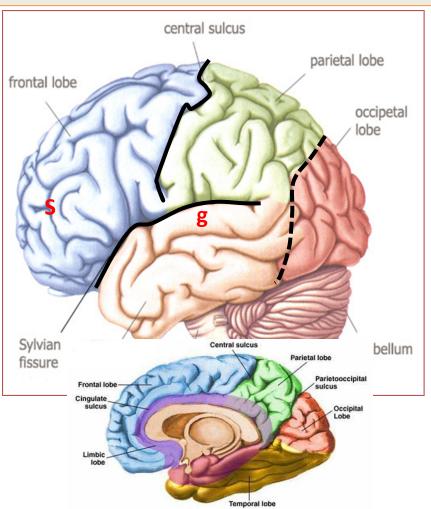

Inferior (tentorial)

Lobes of Cerebrum

The superficial layer of grey matter is highly convoluted to form a complex pattern of ridges (gyri) and grooves (sulci). This arrangement maximizes the surface area of the cerebral cortex (about 70% is hidden within the depths of sulci).

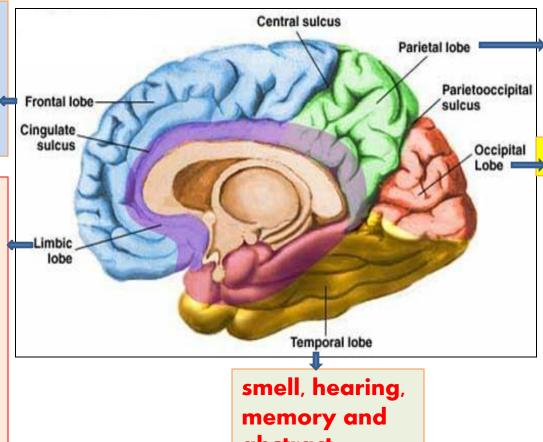

Three sulci, consistent in position, named central, lateral (sylvian) & parietooccipital, divide each hemisphere into **FOUR** lobes: Frontal, Parietal, Temporal & Occipital (named after overlying bones) Functionally each hemisphere contains a 'limbic lobe' on the medial surface.

Function of Lobes

motor function. motivation, aggression, smell and mood

emotions. memory storage & Linking conscious intellectual functions with the unconscious autonomic functions,

reception and evaluation of sensory information

visual processing

abstract thought

☐ Frontal lobe:

- Precentral gyrus.
- Superior & inferior frontal sulci divide the lobe into superior, middle & inferior frontal gyri.

☐ Parietal lobe:

- Postcentral gyrus.
- Intraparietal sulcus divide the lobe into superior & inferior parietal lobules.

Precentral **Postcentral** gyrus gyrus Superior parietal lobule Inferior **Intraparietal** parietal sulcus lobule

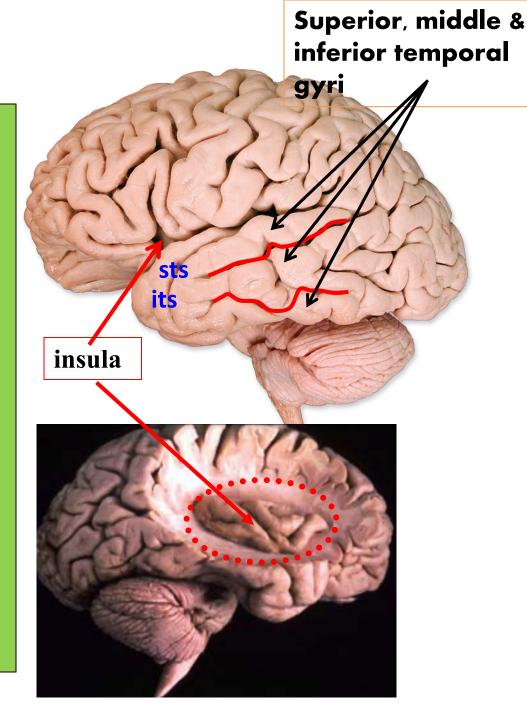

Superior, middle & inferior frontal gyri

MAIN GYRI IN
SUPEROLATERAL
SURFACE

☐ <u>Temporal lobe</u>:

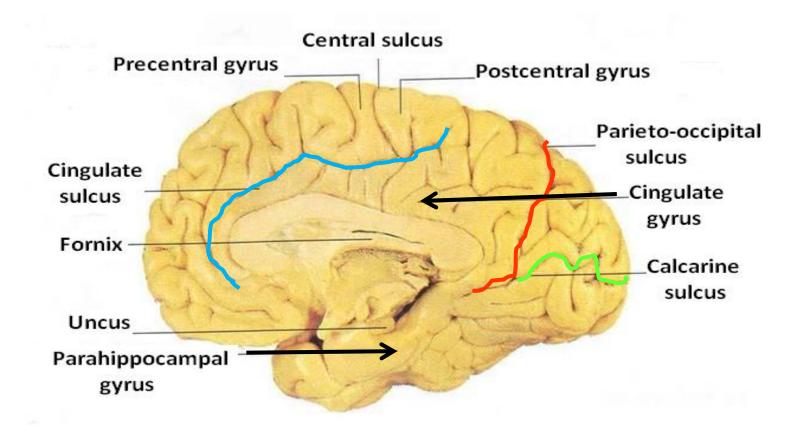

Superior & inferior temporal sulci giving rise to superior, middle & inferior temporal gyri.

Insula: the gyrus in the depth of lateral sulcus, covered by parts of frontal, parietal & temporal lobes called the opercula (removed in lower picture.).

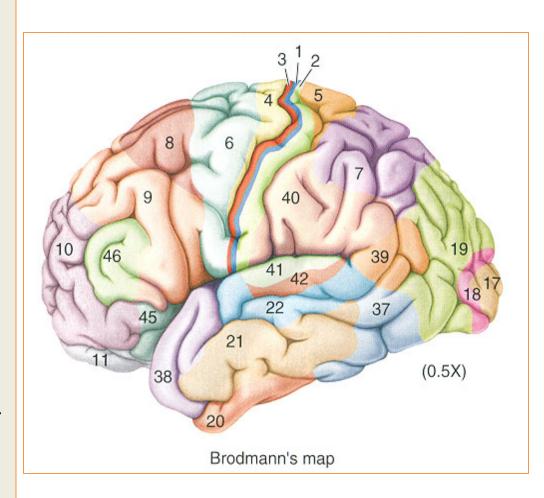

Medial Surface

- > Sulci: Parietooccipital, Calcarine, Cingulate
- > Gyri: Cingulate, Parahippocampal

Brodmann's Map

- Brodmann produced a numbered, cytological map of cerebral cortex based upon its regional histological characteristics.
- Subdivisions with similar cellular and laminar structure are called 'areas'
- Brodmann's numbering of these cortical locations has become one of the standard ways to identify brain areas.

Functional Areas of the Cerebral Cortex

Frontal Lobe

<u>Premotor cortex:</u> Located in the region immediately anterior to the precentral gyrus (Brodmann's area 6).

Prefrontal cortex:
Extensive region
of the frontal lobe
anterior to
premotor area.

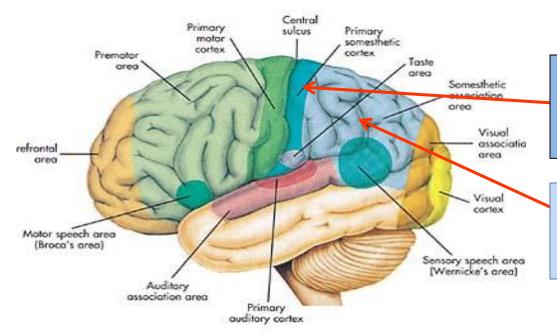

Broca's (motor speech) area: Located in the inferior frontal gyrus of the dominant hemisphere, usually left (Brodmann's area 44 & 45).

area 4).1 Central Primary sulcus Primary motor somesthetic cortex cortex Premotor Taste area area Somesthetic association Visual associatio refrontal area area Visual cortex Motor speech area (Broca's area) Sensory speech area [Wernicke's area) Auditory Primary auditory cortex

<u>Primary motor cortex:</u> Located

in precentral gyrus (Brodmann

<u>Frontal eye field:</u> Located in the middle frontal gyrus immediately in front of motor cortex (Brodmann's area 8).

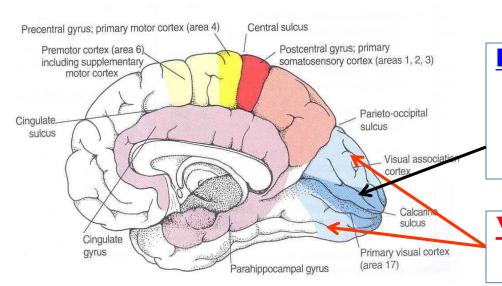

Parietal lobe

Primary somatosensory cortex: located in postcentral gyrus (Brodmann's area 1, 2, 3).

Parietal association cortex:

located posterior to primary somatosensory cortex.

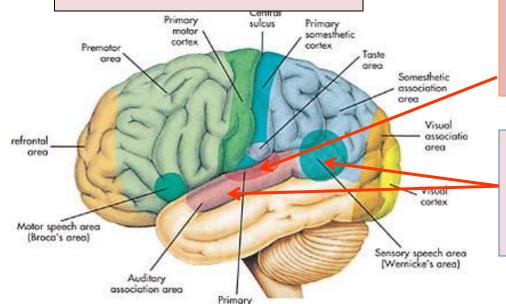

Occipital lobe

Primary visual cortex: located on the medial surface of the hemisphere, in the gyri surrounding the calcarine sulcus (Brodmann's area 17).

Visual association cortex: located around the primary visual cortex. Area 19

Temporal Lobe

auditory cortex

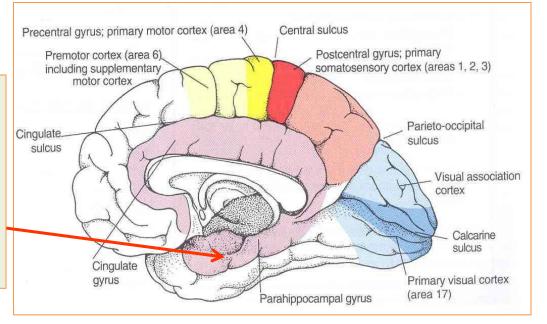

<u>Primary auditory cortex</u>: located in the superior surface of the superior temporal gyrus

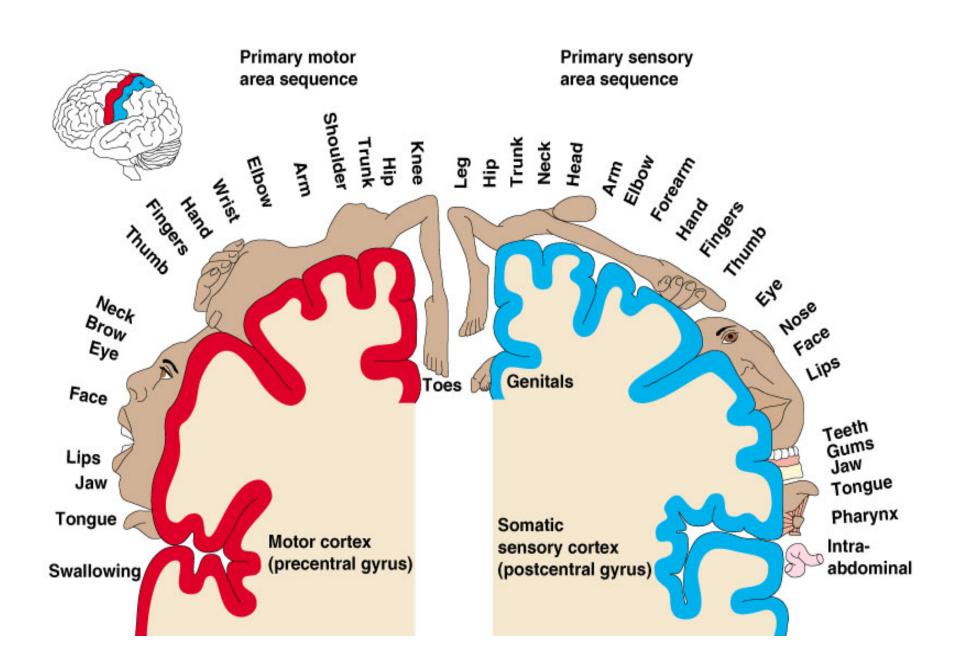

(Brodmann's area 41, 42)

Auditory association cortex: located immediately around the primary auditory cortex (also includes Wernick's area)

Parahippocampal gyrus:

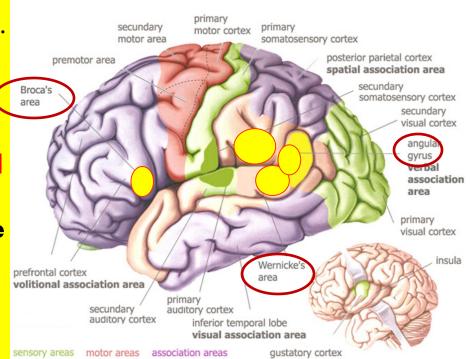

located in the inferomedial part of temporal lobe. Deep to this gyrus lies the hippocampus and the amygdala, which are parts of limbic system

Language Areas

- Organized around the lateral Sulcus.
- Broca's area: concerned with expressive aspects of language.
- Wernick's area: responsible for comprehension of the spoken (words.
- Angular gyrus & Supramarginal gyrus: nearby regions of temporal lobe and parietal lobe o fthe inferior parietal lobule) are important in naming, reading, writing, and calculation.

White Matter

- Underlies the cortex, contains nerve fibers, neuroglia cells and blood vessels.
- The nerve fibers originate, terminate or sometimes both, within the cortex.
- Depending on their origin & termination, these nerve fibers are classified into three types: Association, Projection & Commissural

Association fibers: Unite different parts of the same hemisphere, are of two types: long & short

Commissural fibers: Connect the corresponding regions of the two hemispheres

Projection fibers: Consist of afferent and efferent fibers of the cerebral cortex
