# INTERNAL STRUCTURE OF THE BRAIN STEM

By

DR. Sanaa Alshaarawy

## **OBJECTIVES**

#### By the end of the lecture, students will be able to:

- Distinguish the <u>internal structure of</u> the components of the <u>brain stem</u> in different levels and the <u>specific criteria of each level</u>.
- 1. Medulla oblongata {closed (caudal), mid and open medulla (rostral)}.
- 2. Pons (caudal, mid "Trigeminal level" and rostral).
- 3. Mid brain (superior and inferior colliculi).
- Describe in Breif the Reticular formation (structure, function and pathway).

## CAUDAL (closed) MEDULLA

- 1. Traversed by the Central Canal.
- Motor Decussation\*.
- Spinal Nucleus of Trigeminal (Trigeminal sensory nucleus)\*:
- > It is a larger <u>sensory</u> <u>nucleus.</u>
- > It is the brain stem continuation of the Substantia Gelatinosa of spinal cord.

#### TRIGEMINAL SENSORY NUCLEUS & TRACT

- The Nucleus Extends:
- Through the <u>whole length</u> of the <u>brain stem</u> and <u>upper</u> segments of <u>spinal cord</u>.
- It lies in all levels of M.O, medial to the spinal tract of the trigeminal.
- It receives pain and temperature from face, forehead.
- Its tract present in all levels of M.O. is formed of descending fibers that terminate in the trigeminal nucleus.

#### PYRAMIDAL DECUSSATION

Fasciculus gracilis gracilis Fasciculus cuneatus Nucleus cuneatus Trigeminal. sensory nucleus Spinal tract. of the trigeminal Spinocerebellar Pyramid. Decussation of the pyramids

- It is Motor Decussation.
- Formed by pyramidal fibers, (75-90%) cross to the opposite side
- They <u>descend</u> in the lateral white column of the <u>spinal cord</u> as the lateral corticospinal tract.
- The uncrossed fibers form the ventral corticospinal tract.

#### MID MEDULLA

- Traversed by Central Canal.
- Larger size Gracile & Cuneate nuclei, concerned with proprioceptive deep sensations of the body.
- Axons of Gracile & Cuneate nuclei form the internal arcuate fibers; decussating forming Sensory Decussation.
- Pyramids are prominent ventrally.

## SENSORY DECUSSATION

- Formed by the crossed internal arcuate fibers
- Medial Leminiscus:
  - Composed of the ascending internal arcuate fibers after their crossing.
  - Lies adjacent to the middle line <u>ventral</u> to the <u>central canal</u>
  - Terminates in thalamus.
    - <u>Concerned with</u>
       proprioceptive deep sensation.

- On the ventral aspect :
- The pyramid is clear, with medial lemniscus on either sides of middle line dorsal to the pyramid
- **□** Inferior Olivary Nucleus:
  - A convoluted mass of gray matter., lies posterolateral to the pyramids & lateral to the medial leminiscus.
  - It is <u>concerned with</u> the control of movements.

#### Its dorsal surface forms:

- Lower part of the floor of the 4<sup>th</sup> ventricle.
- The Inferior Cerebellar Peduncle is, connecting M.O. with cerebellaum.
- dorsal and lateral to the Inferior cerebellar peduncle lie the Cochlear nuclei (dorsal and ventral); concerning with hearing.

- Beneath the floor of 4<sup>th</sup> ventricle lie:
- 1. Hypoglossal Nucleus.
- 2. Dorsal vagal nucleus contains preganglionic parasympathetic fibers.
- 3. Medial longitudinal fasciculus, it is important association tract;
- Upwards:
- It links the <u>vestibular nuclei</u> with nuclei of extraocular ms.(3,4&6) <u>as</u> (vestibulo-ocular tract) to help coordination of eye movements with head movements.
  - Downwards:
- It links <u>vestibular nuclei</u> with anterior horne cells of spinal cord (cervical & upper thoracic segments) <u>as</u> (vestibulo-spinal tract)---so, the neck & trunk move with head movements, so maintaining balance of the body trunk and head.

- 4. Vestibular nuclei complex: concerned with equilibrium.
- 5. Nucleus Ambiguus: (motor nucleus): gives motor fibers along glossopharyngeal N. & vagus N. to Ms. of the pharynx, larynx & palate.
- 6. Solitary nucleus (sensory nucleus): receives taste sensation from the tongue along the facial (VII), glossopharyngeal (IX) and vagus (X).
- 7. Tectospinal tract: between tectum of midbrain and spinal cord (involved in head movements during visual and auditory tracking).

## THE PONS

- It is divided into an <u>anterior part</u> (Basis Pontis) & a <u>posterior part</u> (Tegmentum) <u>by</u> the <u>Trapezoid Body</u> (consists of <u>crossed acoustic fibres</u> from <u>cochlear nuclei</u> to ascend into <u>midbrain</u> as <u>lateral lemniscus</u> and terminate in <u>inferior colliculus</u>).
- The ventral portion (In all Levels of Pons): is marked by numerous transversely oriented fascicles of pontocerebellar fibres that originate from scattered cell groups, the pontine nuclei, and that pass to the contralateral side of the cerebellum through the middle cerebellar peduncle.

## CAUDAL PART OF THE PONS

#### 1. Pontine Nuclei:

- Are small masses of nerve cells, receive cortico pontine fibers. Their axons *form* the transverse pontocerebellar fibers which pass to the contralateral side of the cerebellum through Middle Cerebellar peduncles.
- 2. Bundles of corticospinal & corticonuclear fibres (Pyramidal fibres)

## CAUDAL PART OF THE PONS

Somatic sensory area of cerebral cortex

Tertiary sensory neuron

Medial lemniscus

Midbrain

Medial lemniscus

Medial lemniscus

Medial lemniscus

Decussation of medial lemniscus

Dorsal root ganglion

Fasciculus gracilis

Spinal cord

Medial Lemniscus)

Medial Lemniscus

- 3. The ascending fibres of the **Medial lemniscus**
- become <u>separated from the pyramid</u> and <u>displaced</u> <u>dorsally</u>.
- The Medial Lemniscus rotates 90 degrees and lies almost horizontally.
- 4. Spinal tract & nucleus of Trigeminal.
- 5. Deep origin of <u>cranial nerve</u> <u>nuclei:</u>
  - Abducent nucleus
  - Facial motor nucleus

#### AT THE LEVEL OF THE TRIGEMINAL NERVE

- Motor nucleus of the trigeminal nerve: Lies in the lateral part of the floor of the 4<sup>th</sup> ventricle.
- Main sensory nucleus of the trigeminal nerve: it lies <u>lateral</u> to the <u>motor</u> nucleus.
- Superior cerebellar
   peduncles form the lateral
   boundary of the 4<sup>th</sup> ventricle

## **ROSTRAL PONS**

- Superior Medullary Velum:
  - Passes <u>between the two</u> <u>peduncles</u> & forms the <u>roof</u> of the 4<sup>th</sup> ventricle.
- Medial longitudinal fasciculus:
  - Lies close to the midline beneath the floor of the 4<sup>th</sup> ventricle.

## MIDBRAIN

- It is divided into:
- a <u>dorsal part</u> (Tectum) of 4 colliculi; and
- a <u>ventral part</u>
   (Tegmentum) at the level of the <u>cerebral aqueduct</u>.
- The cerebral aqueduct is surrounded by a pear shaped periaqueductal (central) gray matter.
- The <u>most ventral part to</u> the <u>tegmentum</u> is the <u>massive fibrous mass</u> (<u>Crus Cerebri</u>); Present in both levels of colliculi.

## INFERIOR COLLICULUS Level

- Inferior colleculus is a large nucleus of gray matter that lies beneath a corresponding surface elevation.
- It is part of the auditory pathway.
- <u>It receives</u> fibers from the lateral lemniscus.
- Its efferent fibers pass to the thalamus

## INFERIOR COLLICULUS Level

#### 1. Trochlear nucleus:

- <u>lies</u> in the central gray matter close to the median plane.
- The <u>fibers</u> of the <u>trochlear nerve</u> decussate in the superior medullary velum <u>and</u> emerge from posterior surface of midbrain.
- 2. Decussation of the superior cerebellar peduncles in the mid line.

#### 3. ASCENDING LEMINISCI:

#### Composed Of:

- Medial lemniscus.
- Spinal (Lateral & anterior spinothalamic tracts)
- Trigeminal (Lateral & medial).
- Lateral lemniscus.

## INFERIOR COLLICULUS Level

#### 4. Substantia nigra\*:

- Occupies the most ventral part of the tegmentum.
- It consists of pigmented, melanin containing neurones.
- It projects to the basal ganglia. Its degeneration is associated with Parkinson's disease.

#### CRUS CEREBRI

- It is a massive mass <u>ventral</u> to the <u>substantia</u> nigra.
- It consists entirely of descending cortical efferent fibers (Frontopontine, Corticospinal & corticobulbar and Temporopontine Fibres) to the motor cranial nerve nuclei and to anterior horn cells of spinal cord.
- Involved in the coordination of movement.
- Present in both levels of colliculi.

## SUPERIOR COLLICULUS Level

- A large nucleus of gray matter that lies beneath corresponding elevation.
- It forms part of the visual reflexes.
- Its <u>efferent fibers</u> go to the <u>anterior horn cells</u> & to <u>cranial nuclei</u> 3, 4, 6, 7 & 11).
- It is responsible for the reflex movements of the eyes, head and neck in response to visual stimuli.

## SUPERIOR COLLICULUS Level

#### 1. Oculomotor nucleus:

- Situated in the central gray matter.
- The fibers of the oculmotor nerve passes anteriorly through the red nucleus to emerge on the medial side of the crus cerebri

(In interpeduncular fossa).

## SUPERIOR COLLICULUS Level

#### 2. Red nucleus:

- A rounded mass of gray matter that lies in the central portion of the tegmentum.
- Its <u>red coloration</u> is <u>due to</u> its <u>vascularity</u> and the presence of an <u>iron containing pigment</u> in the cytoplasm of its neurons.
- **■** It is involved in motor control.

## RETICULAR FORMATION

- It is a complex matrix of nerve fibers & groups of nerve cells that extends throughout the brain stem.
- It has a number of important functions i.e. Respiratory and Cardio- vascular centers.

## RETICULAR TRACTS

#### Reticulo spinal tracts:

- Descending fibresInfluence a muscle tone & posture
- Reticular Activating system:
  - Ascending fibers activate the cerebral cortex through the thalamus.

## THANK YOU
