

# PITUITARY GLAND

## Objectives:

**By the end of this lecture, the student should be able to describe**

- 1. The microscopic structure of the different parts of the pituitary gland in correlation with their functions.**
- 2. The hypophyseal portal circulation; components and significance.**

# COMPONENTS

## (A) ADENOHYPHYSIS CEREBRI:

### 1- Pars Distalis (pars anterior)

2- Pars Tuberalis

3- Pars Intermedia

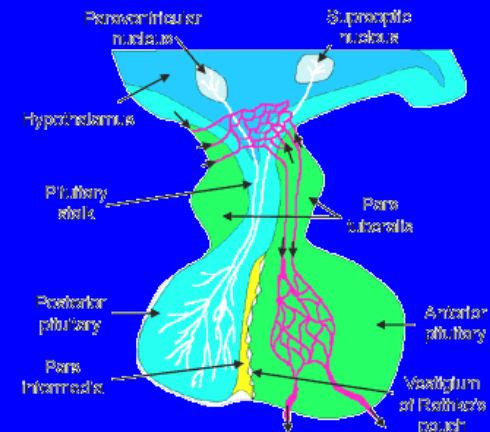

## (B) NEUROHYPHYSIS CEREBRI:

1- Median eminence

2- Infundibulum: Neural

(Infundibular) Stalk (stem)

3- Pars Nervosa

# PITUITARY GLAND

# NEUROHYPOPHYSIS

## (A) PARS NERVOSA

### CONTENTS:

1- Unmyelinated axons of secretory neurons situated in supraoptic & paraventricular nuclei (i.e. Axons of hypothalamohypophyseal tract).

### Function:

Storage & release of:

a- Vasopressin (ADH); *by supraoptic nuclei*

b- Oxytocin; *by paraventricular nuclei*

2- Fenestrated blood capillaries.

### 3. HERRING BODIES:

- Are distentions of the axons in p. nervosa.
- Representing accumulation of neurosecretory granules at axon termini and along the length of the axons in p. nervosa.

### 4. Pitucytes:

Are glial-like cells in p. nervosa.

#### Structure:

Have numerous cytoplasmic Processes.

#### Functions:

Support the axons of the p. nervosa.

N.B. No secretory or neuronal cells in pars nervosa.

# PARS DISTALIS:

## Types of parenchymal cells:

### (1) Chromophils:

#### a- Acidophils:

- 1- Somatotrophs (GH cells).
- 2- Mammotrophs (Prolactin cells):  
Increase during lactation.

#### b- Basophils:

- 1- Thyrotrophs (TSH Cells)
- 2- Gonadotrophs (Gonadotropic cells) (FSH, LH)
- 3- Corticotrophs (ACTH cells)

## (2) Chromophobes: may represent:

- 1- stem cells.
- 2- degranulated chromophils.
- 3- degenerated cells.

Blue arrow: acidophils  
Red arrow: basophils  
Yellow arrow: chromophobes

# BEST WISHES
