CANDIDIASIS

Endocrine block

Students at the end of the lecture will be able to:

- 1. Acquire the basic knowledge about Candida as a pathogen
- 2. know the main infections caused by Candida species
- 3. Identify the clinical settings of such infections
- 4. Know the laboratory diagnosis, and treatment of these infections.

THE ORGANISM

Candida

Candida

- *Candida* is a unicellular yeast fungus.
- It is imperfect reproducing by budding
- <u>Morphology</u>
 - **Microscopy:** Budding yeast cells, and Pseudohyphae.
 - Culture: Creamy colony, fast growing on Sabouraud Dextrose agar (SDA), Blood agar (48 hr)

Candida

- > There are many species of *Candida* (>150)
- > The common species are:
 - Candida albicans,
 - C.parapsilosis
 - C.tropicalis,
 - C.glabrata,
 - C.krusei,

Candida

Human commensal

- Oral cavity
- Skin
- Gastrointestinal tract
- Genitourinary tracts

THE DISEASE

Candidiasis

Candidiasis

Definition:

- Any infection caused by any species of the yeast fungus Candida.
- The most common fungi causing infections in immunocompromised patients
- 4th most common cause of nosocomial blood stream infection

Candidiasis Opportunistic Fungal Infections

- □ Alteration in
 - Immunity
 - Normal physiology
 - Normal flora
- Damage in the barriers
- □ Clinical Spectrum of diseases?

Candida - Clinical

Mucous membrane infections

- Thrush (oropharyngeal)
- Esophagitis
- Vaginitis

Cutaneous infections

- Paronychia (skin around nail bed)
- Onychomycosis (nails)
- Diaper rash
- Chronic mucotaneous candidiasis
 - children with T-cell abnormality

Mucocutaneous infections

- Oropharyngeal Candidiasis
 - Oral thrush:
 - White or grey Pseudomembranous patches on oral surfaces especially tongue with underlying erythema.
 - Common in neonates, infants, elderly
 - In immunocompromised host, e.g. <u>AIDS</u>.
- Esophagitis
- Vulvovaginitis :
 - > Common in pregnancy, diabetics, use of contraceptives.
 - Thick discharge, itching irritation . Lesion appear as white patches on vaginal mucosa.

Cutaneous infections

Intertriginous candidiasis:

Infections of skin folds eg. axilla, buttock, toe web, under breast.

Erythematous lesion, dry or moist or whitish accompanied by itching and burning.

Nail infections:

Onychomycosis and paronychia

Diaper rash

Chronic mucocutaneous candidiasis

Mucosal candidiasis

Oral thrush

Forms of Oral candidiasis

pseudomembranous form

erythematous form

pseudomembranous-erythematous form.

Forms of Oral candidiasis

Hyperplastic candidiasis, that was mistaken for leukoplakia

Cutaneous candidiasis

Chronic mucocutaneous candidiasis

Chronic mucocutaneous candidiasis

Candidiasis

- Urinary tract infection
- Candidemia
- Disseminated (systemic, invasive) infection
 - Endophthalmitis (eye)
 - Liver and spleen
 - Kidneys
 - Skin
 - Brain
 - Lungs
 - Bone

Pulmonary Candidiasis

> Pneumonia ?

- Isolation of Candida from sputum, BAL is not always significant
 - Clinical features
 - Radiology,
 - Other Lab investigations

Candidemia

- Increased colonization (endogenous or exogenous factors)
- Damage in host barriers by catheters, trauma, surgery
- Immunosuppression
- <u>Central venous catheters (CVC)</u>
- Disseminated candidiasis (involvement of any organ)
 - Septic shock
 - Meningitis
 - Ocular involvement (retinitis)

Fever could be the only clinical manifestation

Candidemia

 Candida is the fourth in causing nosocomial bloodstream infections (BSI)
 % Crude

			% BSI			Mortality		
Ran k	Pathogen	BSI per 10,000 admission s	Total (n=20,978)	ICU (n=10,5 15)	Non- ICU (n=10,5 15)	Total	ICU	Non- ICU
1.	CoNS	15.8	31.3	35.9	26.6	20.7	25.7	13.8
2.	Saureus	10.3	20.2	16.8	23.7	25.4	34.4	18.9
3.	Enterococcus spp	4.8	9.4	9.8	9.0	33.9	43.0	24.0
	<i>Candida</i> spp	4.6	9.0	10.1	7.9	39.2	47.1	29.0
5.	E coli	2.8	5.6	3.7	7.6	22.4	33.9	16.9
6.	<i>Klebsiella</i> spp	2.4	4.8	4.0	5.5	27.6	37.4	20.3
7.	P aeruginosa	2.1	4.3	4.7	3.8	38.7	47.9	27.6
8.	Enterobacter spp	1.9	3.9	4.7	3.1	26.7	32.5	18.0
9.	<i>Serratia</i> spp	0.9	1.7	2.1	1.3	27.4	33.9	17.1
10.	A baumannii	0.6	1.3	1.6	0.9	34.0	43.4	16.3

Wisplinghoff H, et al. *Clin Infect Dis.* 2004;39:309-317.

Specimen depend on site of infection.

Swabs, Urine, Blood, Respiratory specimens, CSF, Blood

<u>1. Direct microscopy</u> :

Gram stain, KOH, Giemsa, GMS, or PAS stained smears.

Budding yeast cells and pseudohyphae will be seen in stained smear or KOH.

2. Culture:

Media: SDA & Blood agar at 37°C,

Creamy moist colonies in 24 - 48 hours.

3. Blood culture

Blood culture

USES:

Detection of circulating microorganisms in blood

DESCRIPTION

Different types of blood culture bottles and blood volumes required

> Two sets of cultures before starting antibiotics is ideal

Laboratory identification of Yeast

Because C. albicans is the most common species to cause infection

- > The following tests are used to identify C. albicans:
 - Germ tube test : Formation of germ tube when cultured in serum at 37°C
 - 2. Chlamydospore production in corn meal Agar
 - 3. Resistance to 500 μ g/ml Cycloheximide
- If these 3 are positive this yeast is C.albicans,
- If negative, then it could be any other yeast,
 - Use Carbohydrate assimilations and fermentation.
 Commercial kits available for this like: API 20C, API 32C

Germ tube test

Chlamydospores of *C. albicans* in CMA

■ Culture on Chromogenic Media (CHROMagar[™] Candida)

Candida species

Candida albicans

Sabouraud Agar Morphology: Creamy white yeast, may be dull, dry irregular and heaped up, glabrous and tough

Chromagar

producing green pigmented colonies on specially designed medium to speciate certain yeasts based on color they produce

Yeast Identification

Carbohydrates assimilation test , API 20C

4. Serology:

Patient serum

Test for Antigen , e.g. Mannan antigen using ELISA

Test for Antibodies

Candidiasis- Treatment

Oropharyngeal:

D Topical Nystatin suspension, Clotrimazole troches ,Miconazole, Fluconazole suspension.

Vaginitis:

Miconazole, Clotrimazole, Fluconazole

Systemic treatment of Candidiasis

- Fluconazole
- Voriconazole
- Caspofungin
- Amphotericin

In candidemia :

- Treat for 14 days after last negative culture and resolution of signs and symptoms
- Remove catheters, if possible

Candidiasis- Treatment

Antifungal susceptibility testing in not done routinely in the microbiology lab.

It is done in the following cases:

- For fungi isolated from sterile samples
- If the patient is not responding to treatment
- In case of recurrent infections

Points to consider:

- C. glabrata can be less susceptible or resistant to fluconazole
- C. krusei is resistant to fluconazole

THANK YOU
