

OSTEOPOROSIS and drugs used

Dr. Ishfaq Bukhari
Associate Professor of
Pharmacology
Dept of Medical Pharmacology
King Saud University Riyadh

OSTEOPOROSIS

ILOS

By the end of this lecture you will be able to:

- ✿ **Revise the composition, regulation & the remodeling stages of bone turnover**
- ✿ **Recognize the interlinks of osteoblastic & osteoclastic function**
- ✿ **Relate changes to the development of osteoporosis**
- ✿ **Classify drugs according to their replacement, antiresorptive or anabolic mechanism of action**
- ✿ **Detail the pharmacology of such group of drugs & their clinical utility in combating osteoporosis**

OSTEOPOROSIS ;Key points

OSTEOPOROSIS: “The Silent Disease”

“Osteo” is Latin for “bone”

“Porosis” means “porous or full of holes”

“Osteoporosis” means “bones that are full of holes”

TYPES OF BONE

- (1) Cortical – is hard, compact, dense bone (eg long-bones of arms and legs)**
- (2) Trabecular – is spongy, porous and flexible bone (example: end of the wrist, hip and the spine)**

HEALTHY BONE

Bone is living tissue, which is constantly being broken down and rebuilt, a process called **remodeling**

Bone is renewed like skin, hair and nails

BONE “REMODELING”

Resorption-
removes old
bone

Formation-
replaces old bone
with new bone

BONE “REMODELING” OSTEOCLASTS-PHASE 1

Cells called osteoclasts (think “C” for cutting of bone) seek out old bone or damaged bone tissue and destroy it, leaving small spaces (resorption)

BONE “REMODELING”

OSTEOBLASTS – PHASE 2

Cells called osteoblasts (think “B” for builder) use minerals like calcium, phosphorus, and vitamin D to fill in the spaces with new bone (formation)

BUILD YOUR BONE BANK

You build bone until about age 30

**Steps to building healthy bones
include:**

Calcium & vitamin D

Limit Caffeine & Alcohol

Exercise

Don't Smoke

Bone is basically composed of 2 types of tissues

INORGANIC → 65% of mass → Consists of crystalline calcium phosphate salts (hydroxyapatite)

Organic → 35% of mass → Consists of (osteoblasts, osteoclasts and osteocytes).

◆ Bone cells are either; **Bone Forming** or **Bone Resorptive**

A. Bone Forming Cells:

- Osteogenic cells → mesenchymal in origin → are found on all bone surfaces
- Osteoblasts → forms osteoid framework & help in its mineralization

B. Bone Resorptive Cell:

Osteoclasts →

Reside in pits (resorption bays) that form by eaten bone surface. Secrete lysosomal enzymes (collagenase & metalloproteinase) + hydrochloric a. → dissolve bone matrix

NORMALLY

bones continuously form & resorb

→ **BONE REMODELING**

Under control of systemic hormones, body mineral contents & local autocrine-paracrine secretions (Cytokines, Growth Factors, PGs)
It is meant to maintain calcium homeostasis & to renew bone in repair of microdamage & microcracks

OPG and bone

BONE REMODELING

OSTEOPOROSIS

A complex endocrinologic disorder of bone & mineral metabolism (bone resorption > formation)

Low bone mass
Disruption of bone architecture

Reduced bone strength
Risk of fractures

OSTEOPOROSIS

PREVENTION

TREATMENT

Potentially Modifiable

Current cigarette smoking
Diet low in calcium/vitamin D
Glucocorticoids, anticonvulsants
Excessive alcohol intake
Sedentary lifestyle
Body weight
Environmental risks

Nonmodifiable

Personal history of fracture
1st-degree relative has fracture
Race (Caucasian or Asian)
Elderly age
Poor health
Dementia
Hormonal disorders
Neoplastic disorders
Metabolic abnormalities

Bone balance

Normal

Decreased

Decreased +++

Trabecular bone

Normal

Thinning

Thinning + perforation

TREATMENT OF OSTEOPOROSIS

Replace what is missing....Ca, Vit D, Na fluoride
Reset back the balance of remodeling

*Used to enhance the strength by the formation of fluorapatite.
Is considered only when trabecular bone is ↓ in presence of
normal cortical bones*

ANTIRESORPTIVE AGENTS

- ✓  BISPHTHONATES
- ✓  ESTROGEN ANALOGES
- ✓  ANDROGEN ANALOGES
- ✓  SERMS
-  CALCITONIN
- ✓  RANKL INHIBITORS

BONE ANABOLIC (building) AGENTS

 (Parathyroid hormone; TERIPARATIDE

✓  STRONTIUM

BISPHOSPHONATES

Are compounds that have two phosphonate (PO_3) groups

Non-Nitrogenous

Etidronate

Clodronate

Tildronate

Nitrogenous

Alendronate p.o

Ibandronate p.o

Risedronate p.o

Zoledronate i.v

Bisphosphonate

Pyrophosphate

Mechanism

Are structurally similar to pyrophosphate,

They preferentially "stick" to calcium → concentrate in bones, bound to hydroxapatite, decreasing its solubility and making it more resistant to osteoclastic activity.

They prevent bone resorption by inhibiting osteoclast function.

Their relative potencies for osteoclast inhibition is the most with 3rd generation "Zoledronate"

BLOCK STEPS IN CHOLESTROL SYNTHETIC PATHWAY IN OSTEOCLAST

that act as signaling molecules responsible for the osteoclastic hydrolytic & phagocytic activity.

Stop function → apoptosis
(increased death of osteoclast)

How do they inhibit osteoclasts??? → It is also taken up by osteoclast
→ blocks steps in cholesterol synthetic pathway within osteoclast → end up by osteoclast apoptosis .

Kinetics

- ▣ Poorly abs (< 10%), food impair absorption more → must be given on an empty stomach. / infused IV.
- ▣ $t_{1/2}$ 1 hr.
- ▣ Half of absorbed drug accumulates in bones, remainder → excreted unchanged in urine.
- ▣ In bone it is retained for months, depending on bone turnover.

Indications

- ▣ Osteoporosis, 2ndry to menopause, glucocorticoids,
- ▣ Paget's Disease
- ▣ Malignancy- associated hypercalcaemia

Dosing

Once weekly, or on two consecutive days each month
Should be taken in upright position (to avoid esophagitis).
Separate 4 hrs before giving Ca, Mg, Al containing drugs

Note : calcium and vit D supplementation given during bisphosphonate therapy don't ingest it along with bisphosphonate, give a gap as mentioned above...?

ADRs

- GIT irritation; nausea, vomiting, gastritis , ulceration → to avoid give large amount of water to avoid risk of the tablet getting stuck in the esophagus
- Gastro-esophageal reflux + ulcerations → to avoid give on empty stomach while sitting in upright for 30 min
- Flue like manifestations (fever, chills) upon IV infusion
- Osteo-necrosis of the jaw [mandible > jaw] more upon long use with IV infusion preparation usually after dental surgical procedures.
- If a dental implant or extraction is already planned, delay bisphosphonate therapy for a few months until healing of the jaw is complete

■ Atrial fibrillation > women with alendronate & zolidronate

Contraindications

- Decreased renal function and Peptic ulcer / esophageal reflux

RANKL INHIBITORS →

DENOSUMAB (still under investigation)

It is a fully human MOA that mimics the activity of osteoprotegerin

Mechanism

It binds to RANKL, expressed by osteoblasts → blocks RANKL from interacting with RANK expressed on preosteoclasts → ↓ osteoclastogenesis (no mature osteoclasts).

It binds also to mature osteoclast → its apoptosis

So net effect → ↓ bone resorption.

Administration

Subcutaneous every 6 month

Contraindications

In patients with hypocalcemia. Correct Ca & Vit D levels before starting denosumab

Mechanism of action of Denosumab:

RANKL binds to its receptor RANK on the surface of precursor and mature osteoclasts, and stimulates these cells to mature and resorb bone. OPG, which competes with RANK for binding to RANKL, is the physiological inhibitor of RANKL. **Denosumab** binds with high affinity to RANKL, mimicking the effect of OPG.

Note: Denosumab decreases serum calcium conc, should not be given to patients with hypocalcemia.

Its extremely expensive and reserved for patients who can not tolerate or respond to bisphosphonate

ADRs

- ✚ Infections;
urinary & respiratory
- ✚ Eczema & skin rash
- ✚ pancreatitis

STRONTIUM

Sr^{2+} , is a divalent cation, resembling Ca^{2+} in atomic & ionic properties. It is orally active as distrontium

Mechanism

1st drug to possess “ dual action “ i.e has both anabolic & antiresorptive effects resulting in a rebalance of bone turnover in favor of bone formation.

On Osteoblast;

Since it is like Ca, it acts as agonist on Ca Sensing Receptor [CaSR] ; which is a GP coupled receptor that enhances differentiation of preosteoblast to osteoblast → ↑ bone formation

It stimulates the expression of OPG → ↑ RANKL binding → -ve of osteoclastogenesis → ↓ bone resorption

On Osteoclast;

Acts as agonist on Ca Sensing Receptor [CaSR] → suppress differentiation of preosteoclast to osteoclast → ↑ osteoclast apoptosis → ↓ bone resorption

Strontium ranelate: unique treatment with a dual effect on bone turnover

Pharmacokinetics

- Orally with a modest bioavailability → 25%
- Binds partially to plasma proteins and strongly to bones
- $t_{1/2}$ → 60 hrs
- Excreted mainly by the kidney

Indications

- Osteoporosis, 2ndry to menopause, glucocorticoids,
- Malignancy- associated hypercalcaemia

Contraindications

- In severe renal disease.
- In hypersensitivity to it
- In increased risk of venous thromboembolism
- In phenylketonuria

Interactions

- Food specially containing milk_± its products →
- Antacids →
- Oral tetracycline & quinolones chelate it

Precautions

2hrs spacing

ADRs

GIT irritation; nausea, vomiting, headache, eczema
All resolve in 1st 3 months

ESTROGENS

If hysterectomy + progestins if uterus present

HRT

Menopausal Symptoms

SERMs

Menopause / Elderly

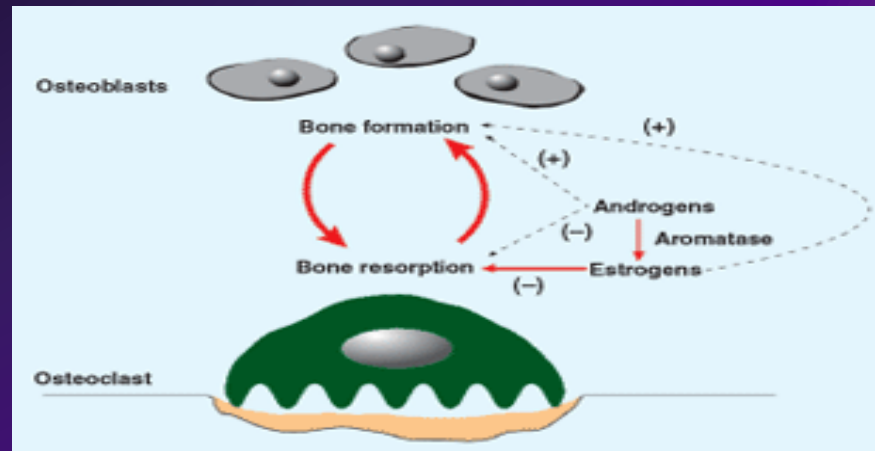

ANDROGENS

Elderly men

Estrogen in females & Androgen in males is essential for normal bone remodeling

- ↑ osteoclast apoptosis & inhibit osteoblast apoptosis
- ↓ No. & depth of resorption cavities
- ↑ release of growth factors from osteoblasts
- ↓ release of inflammatory cytokines causing resorption

Adverse effects: HRT (estrogen): vaginal bleeding, risk of breast cancer, and venous thromboembolism

SERMs →

RALOXIFENE

1st selective estrogen Receptor modulator (SERM) for prevention and treatment of osteoporosis

Mechanism

Antiestrogens that exhibits partial agonistic action; acting as an agonist in bone & an antagonist in some female sex organs

| | Brain | Uterus | Vagina | Breast | Bone | CVS |
|-------------------|-------|--------|--------|--------|------|-----|
| Estradiol | ++ | ++ | ++ | ++ | ++ | ++ |
| Raloxifene | — | — | — | — | + | + |

➤ Advantages

- ↑ bone density (2%) & ↓ fracture risk (30%)
- No stimulation of breast or endometrial tissue
- No need for progestin in women with uterus
- ↓ LDL
- Good for women with risk of uterine and breast cancer.

Lower risk of thromboembolism compared to estrogen

➤ Disadvantages

- May ↑ hot flushes
- No effect on HDL

Relative efficacy of different therapeutic interventions on bone mineral density of the lumbar spine

An illustration comparing a healthy bone structure with one affected by osteoporosis. On the left, a vertical section of a bone shows a dense, porous internal structure. On the right, a larger, more complex bone structure is shown, appearing significantly more porous and fragile. The background is a gradient from purple to blue.

OSTEOPOROSIS

GOOD LUCK
