

# Acute Coronary Syndrome

Prof. Hussam F. Al-Faleh  
Cardiac Sciences Department

**Why is Acute  
coronary syndrome  
important ?**

**#1 Killer**

Morbidity and mortality rates of CAD in selected regions for 1990, estimated morbidity and mortality rates of CAD in selected regions for 2020, and projected increase in mortality from CAD from 1990 to 2020, for men and women

Region	Men			Women		
	1990 (millions)	2020 (millions)	Projected increase in mortality (%)	1990 (millions)	2020 (millions)	Projected increase in mortality (%)
Established market economies	390	434	46	40.7	45.5	32
India	439	608	127	41.0	58.9	114
China	585	727	108	54.8	72.1	79
Sub-Saharan Africa	252	555	144	25.8	56.5	116
Latin America	222	331	144	22.3	33.6	141
Middle East	256	496	171	24.7	48.7	148

30% of ER admissions are cardiac

# Objectives

- Pathophysiology of ACS- **How?**
- Classification of ACS- **How to label?**
- Diagnostic workup- **Recognize it?**
- Initial management- **Save a life?**
- Common complications of ACS- **The aftermath?**

# Resources

- Davidson or Kumar
- Lecture
- Optional reading (4 articles)

# What are coronary arteries ??

# Artery histology

What are the risk factors for  
CAD?

# Diabetes Mellitus

One of every 4 Saudis has DM

# Smoking

# Hypertension

# Hyperlipidemia

# Obesity

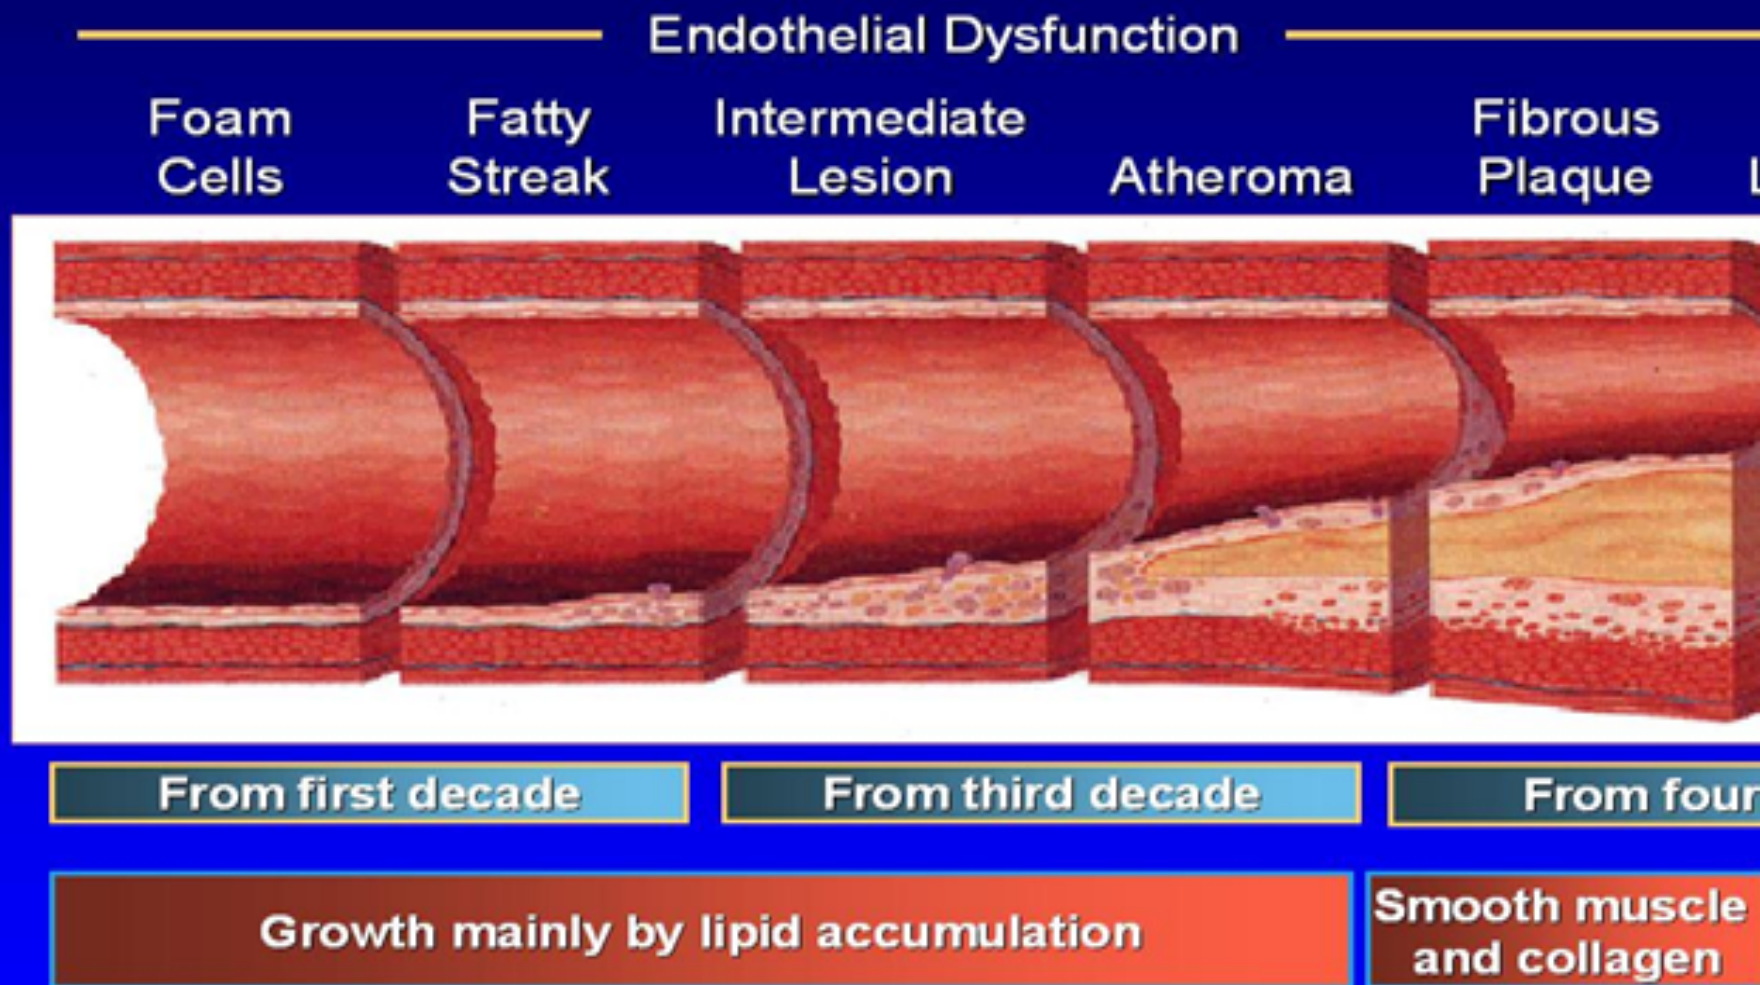

# Other Risk factors

- **Age** : males  $\geq 45$ , females  $\geq 55$
- **Gender** (Male gender)
- **Family history of Premature CAD:**  
males  $\leq 55$  females  $\leq 65$
- **Stress** ???

# Role of genetics??

Known modifiable risk factors  
explain >90% of the occurrence of  
MI in populations around the world

# Atherosclerosis Timeline

Stary et al. *Circulation*. 1995;92:1355-1374.

# Angina Pectoris

**The remarkable facts, that the paroxysm, or indeed the disease itself, is excited more especially upon walking up hill, and after a meal; that thus excited, it is accompanied with a sensation, which threatens instant death if the motion is persisted in; and, that on stopping, the distress immediately abates, or altogether subsides; have . . . formed a constituent part of the character of Angina Pectoris**

**John Warren, 1812**

# Atherosclerosis Timeline

From first decade

From third decade

From fourth decade

Growth mainly by lipid accumulation

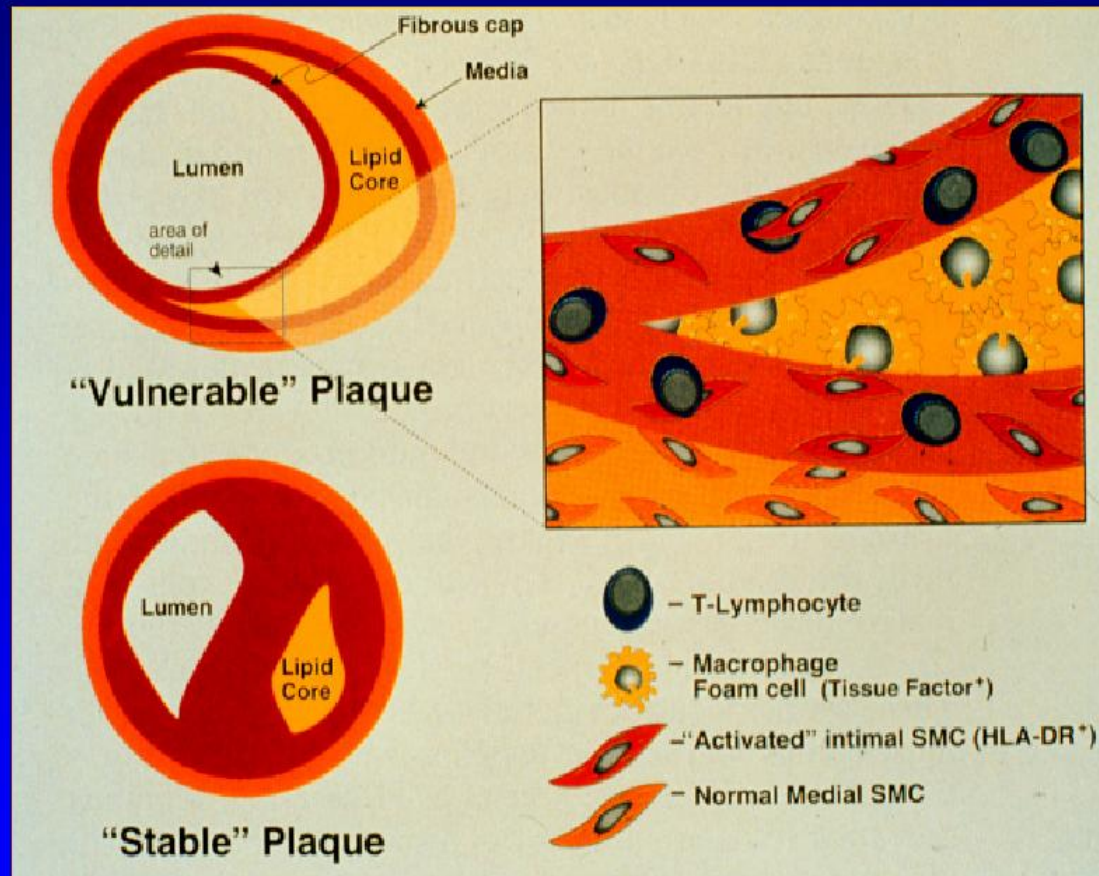

Smooth muscle and collagen

Thrombosis, hematoma

Stary et al. *Circulation*. 1995;92:1355-1374.

# “Vulnerable” Plaque and “Stable” Plaque

Secretion of  
Matrix  
metalloprotenases

Libby. *Circulation*. 1995;91:2844-2850.

**Unstable  
Angina**

**No Myocardial Necrosis**

**Non ST Elevation-Acute coronary syndrome**

**NSTE-ACS**

# **What is Myocardial Infarction?**

# Third Universal Definition of MI

- Typical rise in **cardiac troponin T or I** , **CK-MB** with at least one of the following:
  1. Ischemic symptoms
  2. Pathological Q wave on ECG
  3. Ischemic ECG changes (e.g ST elevation or depression, new LBBB)
  4. Imaging evidence of new loss of viable myocardium or a new WMA
  5. Identification of an intracoronary thrombus by angiography or autopsy.

# Nuclear imaging

# **MARKERS FOR MYOCARDIAL NECROSIS**

# Creatin Kinase (CK)

- MI causes release of certain enzymes and proteins into the blood stream.
- Creatin Kinase (CK) is released from multiple organs such as the myocardium , skeletal muscles, and the brain.
- The Iso-form CK-MB, is cardio-specific
- Starts to rise 4-6 hrs after onset of ischemia, then falls within 48-72hrs.

# Troponin

- Cardiospecific proteins Troponin I, and T are the most sensitive & specific markers for myonecrosis.
- Released with 4-6hrs, but can last upto 2 weeks

# Relationship between onset of MI and release of markers

**BACK TO RASHED IN ER**

***Management***

# Aims of therapy

- Open Artery and Improve oxygen supply
  1. Supplemental O<sub>2</sub>
  2. Coronary vasodilators ( Nitroglycerine)
  3. Antiplatelet agents
  4. Reperfusion therapy
    - a. Fibrinolytic therapy
    - b. Primary Percutaneous coronary intervention (PCI)
  5. Antithrombotic agents

# Aims of therapy

- Reduce O<sub>2</sub> demand
  1. Beta blockers ( Propranolol, Metoprolol)
  2. Analgesics ( Morphine)
- Other medications
  - ACE inhibitors( Enalapril, Lisinopril)
  - Statin therapy

# Reperfusion therapy

# Fibrinolytics

- ONLY USED FOR STEMI ( NOT NSTEMI)
- Reduces short and long term mortality
- Should be given during a 12hr window, and given ASAP.
- 2 types of fibrinolytics:
  1. Non Fibrin specific  
( Streptokinase)
  2. Fibrin specific

# Fibrin specific agents

Characteristic	Alteplase (t-PA)	Retepase (rPA)	Tenecteplase (TNK)	Lanoteplase (nPA)
Immunogenicity	No	No	No	?
Plasminogen activation	Direct	Direct	Direct	Direct
Fibrin specificity	++	+	+++	+
Plasma half-life	4–6 min	18 min	20 min	37 min
Dose	15-mg bolus plus 90-min infusion up to 85 mg	10+10-MU double bolus 30 min apart	±0.5 mg/kg single bolus	120 KU/kg single bolus
PAI-1 resistance	No	?	Yes	?
Genetic alteration to native t-PA	No	Yes	Yes	Yes
	Recombinant version	Finger, EGF, and kringle-1 regions deleted	2 single amino acid substitutions in kringle-1 and substitution of 4 amino acids in catalytic domain	Finger, EGF regions deleted and glycosylation sites in kringle-1 domain modified

## Absolute contraindications

Any prior intracranial hemorrhage

Known structural cerebral vascular lesion

Known intracranial neoplasm

Ischemic stroke within the past 3 months (except for acute stroke within 3 hours)

Suspected aortic dissection

Active bleeding or bleeding diathesis (excluding menses)

Significant closed-head or facial trauma within 3 months

## Relative contraindications

History of chronic, severe, poorly controlled hypertension

Systolic pressure  $>180$  mm Hg or diastolic  $>110$  mm Hg

History of prior ischemic stroke  $>3$  months previously, dementia, or known intracranial pathology not covered in absolute contraindications

Recent (within 2–4 weeks) internal bleeding

Noncompressible vascular punctures

Pregnancy

Active peptic ulcer

Current use of anticoagulants: the higher the INR, the higher the risk of bleeding

For streptokinase/anistreplase: prior exposure (more than 5 days previously) or prior allergic reaction to these agents

**PRIMARY PCI**

Adopted from N Eng J Med 2007

# PERCENT OF HEART MUSCLE SAVED FROM ONSET OF HEART ATTACK TO EMERGENCY-ROOM TREATMENT

**Door to needle time <30min**  
**Door to balloon time <90min**

# Antiplatelet Agents

# Aspirin (ASA)

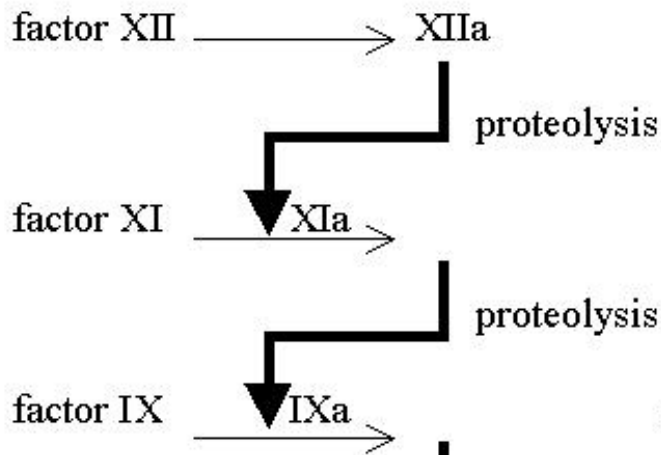

- ASA is Chewable 160 to 325 mg at presentation, then 75 to 325 mg daily.

# P2Y<sub>12</sub> inhibitors

- More potent than ASA and is combined with ASA
- Both agents are powerful adjuncts to reperfusion therapy
- Examples:
  1. Clopidogrel
  2. Ticagrelor
  3. Prasugrel

# ANTITHROMBOTICS

## intrinsic pathway

## extrinsic pathway

# Antithrombotics

- Heparin
  - Unfractionated
  - Low molecular
- Prevents further thrombosis and aids in insuring patency of the occluded artery.

# Back to Rashed in ER

- Was given chewable ASA
- 3 Sublingual Nitro tablets
- Just prior to arrival to cardiac cath lab for primary PCI, he lost consciousness .....

# Ventricular Fibrillation

# Complications of MI

- **Electrical ( Arrhythmia )**
- **Heart failure (Pulmonary Edema)**
- **Cardiogenic Shock**
- **Mechanical complications ( usually occurs late after MI ...days to weeks )**

# Summery

- Plaque vulnerability is affected by an inflammatory process
- Acute coronary syndromes is a spectrum and is classified according to markers of ST changes and Myocardial necrosis
- In STEMI , time to reperfusion is critical in myocardial salvage ( time is muscle)
