SLE

Prof.Abdurhman Saud Alarfaj
BSc.,MB.,CHB.,FRCP(uk).,FRCP(C).,FACP.,FACR

Systemic lupus erythematosus (SLE)

Systemic lupus erythematosus (SLE)

Definition

 chronic, multisystem inflammatory disease characterized by autoantibodies directed against self-antigens, immune complex formation, and immune dysregulation resulting in damage to essentially any organ.

Background:

- First written description in13th century(Rogerius) named it lupus(Latin for wolf) as cutaneous similar to a wolf bite.
- Osler recognized systemic features without skin.
- Diagnosis with (LE) cells in 1948.
- In 1959, anti-DNA.

Hochberg MC. Updating	the American College o	f Rheumatology revised crit	eria for the classification o	f systemic lupus erythemat	tosus [letter]. Arthritis Rheum
1997:40:1725.					

Fixed erythema, flat or raised, over the malar eminences, tending to spare the

Erythematous raised patches with adherent keratotic scaling and follicular

Skin rash as a result of unusual reaction to sunlight, by patient history or

Oral or nasopharyngeal ulceration, usually painless, observed by physician

Nonerosive arthritis involving 2 or more peripheral joints, characterized by

b) Pericarditis--documented by ECG or rub or evidence of pericardial effusion

a) Persistent proteinuria greater than 0.5 grams per day or grater than 3+ if

b) Cellular casts--may be red cell, hemoglobin, granular, tubular, or mixed

a) Pleuritis--convincing history of pleuritic pain or rubbing heard by a

plugging; atrophic scarring may occur in older lesions

nasolabial folds

physician observation

OR

OR

tenderness, swelling, or effusion

quantitation not performed

physician or evidence of pleural effusion

1. Malar rash

2. Discoid rash

4. Oral ulcers

5. Arthritis

6. Serositis

7. Renal disorder

3. Photosensitivity

disorder	derangements; e.g., uremia, ketoacidosis, or electrolyte imbalance <i>OR</i> b) Psychosisin the absence of offending drugs or known metabolic derangements, e.g., uremia, ketoacidosis, or electrolyte imbalance
9. Hematologic disorder	 a) Hemolytic anemiawith reticulocytosis OR b) Leukopenialess than 4,000/mm<>3<> total on 2 or more occasions OR c) Lyphopenialess than 1,500/mm<>3<> on 2 or more occasions OR d) Thrombocytopenialess than 100,000/mm<>3<> in the absence of offending drugs
10. Immunologic disorder	a) "Positive finding of antiphospholipid antibodies based on 1) an abnormal serum level of IgG or IgM anticardiolipin antibodies, 2) a positive test result for lupus anticoagulant using a standard method, or 3) a false-positive serologic test for syphilis known to be positive for at least 6 months and confirmed by <i>Treponema pallidum</i> immobilization or fluorescent treponemal antibody absorption test. "Standard methods should be used in testing for the presence of b) Anti-DNA: antibody to native DNA in abnormal titer OR c) Anti-Sm: presence of antibody to Sm nuclear antigen OR d) False positive serologic test for syphilis known to be positive for at least 6 months and confirmed by <i>Treponema pallidum</i> immobilization or fluorescent treponemal antibody absorption test
11. Antinuclear antibody	An abnormal titer of antinuclear antibody by immunofluorescence or an equivalent assay at any point in time and in the absence of drugs known to be associated with "drug-induced lupus" syndrome

a) Seizures--in the absence of offending drugs or known metabolic

8. Neurologic

EPIDEMIOLOGY:

- Locally:
 - 2 cases of SLE among 10,372 studied (prevalence of 19.28 per 100,000).
- Internationally:

variable prevalence :.

- Denmark (21.7/100,000).
- Britain, 12 cases per 100,000.
- India prevalence (3.2/100,000) .
- 39 cases per 100,000 population in Sweden.

AETIOLOGY:

Specific cause(s) of SLE is unknown.

multiple factors are associated include :

- Genetic

- Hormonal

- Racial

Environmental factors

AETIOLOGY(cont.):

- Genetic predisposition :
 - Multitude of genetic associations suggests a complex genetic predisposition.
 - Concordance rate in monozygotic twins is 25-70%.
 - If a mother has SLE, her daughter's risk of developing the disease is 1:40, and her son's risk is 1:250.
 - Relatives have a high prevalence of other autoimmune diseases.
 - HLA-DR2 and HLA-DR3 and other HLA genes occur more often in SLE than in the general population.
 - null complement alleles and congenital deficiencies of complement (C4, C2, and other early components) are associated with an increased risk of SLE.

AETIOLOGY(cont.):

Hormonal factors:

- F:M ratio of prevalence in different age groups:
 - In children, f:m ratio is 3:1.
 - In adults, f:m ratio is 10-15:1
 - In older, the ratio is approximately 8:1.
- Age at onset :
 - 65% have onset between 16 and 55.
 - 20% before age 16, and
 - 15%t after age 55.
- Higher prevalence in men with Klinefelter disease.
- Exogenous estrogen and exacerbations of SLE.
- Men at all ages have the same risk of disease as women who are prepubertal or postmenopausal
- Males do not have an age-related peak in incidence.

Sle in saudi arabia kkuh.

sex	number	percent
male	58	9.3
female	566	90.7
total	624	100

AETIOLOGY(cont.):

- Racial and geography:
 - Higher prevalence (2.5- to 6-fold) in USA African American women than in white women.
 - But,cf occurs infrequently in Blacks in Africa.
 - Higher among Asians, Afro-Americans, Afro-Caribbeans, Hispanic Americans, and Asian Indians.
 - More common in urban than rural areas .

- □ Also In New Zealand, 50 per 100,000 Polynesians, but only 14.6 cases per 100,000 in the whites.
- In France, more common among immigrants from Spain, Portugal, North Africa, and Italy .

AETIOLOGY(cont.):

- Environmental:
 - worldwide variability of prevalence the disease(black in africa and US)
 - influence of environmental factors on the course of the disease, eg:
 - ultraviolet light
 - viruses
 - drugs.cause or exacerbate
 - silica dust.
 - cigarette smoking.
 - alfa alfa sprouts.

Pathophysiology:

- Disturbances in the immune system :
 - High ratio of CD4+ to CD8+ T cells.
 - Defects in immune cell tolerance leading to
 - production of autoantibodies targeting antigens located in nuclei, cytoplasm, on cell surfaces, and in plasma proteins.
 - autoantibodies leads to mostly immune complex formation (e.g kidney) and direct antibody-mediated cytotoxicity (hemolytic anemia, thrombocytopenia).
 - Cell-mediated autoimmunity also play part.
 - Tissue damage follows

Primary Central Nervous System Lupus: Neurologic Signs or Symptoms

Meninges

Headache Ataxia

Meningismus Spine

Cerebrum Paraparesis

Dementia Multiple sclerosis-like disorder

Strokes Cranial and peripheral nerves

Subarachnoid hemorrhage Cranial and peripheral sensory, motor

neuropathies

Cerebellum

Mononeuritis multiplex

Myasthenia gravis

Guillain-Barre syndrome

Migraine

Other headaches

Seizures

Chorea

Rigidity, tremor

SIADH

Special considerations:

Drug-induced lupus

(consider before diagnosing native lupus)

Sex ratios are nearly equal.

Nephritis and CNS not common.

No anti- native DNA or hypocomplementemia.

resolution on discontinuation of drug

Drugs associated with lupus erythematosus

Definite association

- Chlorpromazine
- Methyldopa
- Hydralazine
- Procainamide
- Isoniazid
- Quinidine

Unlikely Association:

- Allopurinol,
- Penicillin, Chlorthalidone,
 Phenylbutazone, Gold salts,
 Reserpine, Griseofulvin, Streptomy
 cin, Methysergide, Tetracyclines, Or
 al contraceptives

Possible Association

- Betablockers
- Methimazole
- Captopril
- Nitrofurantoin
- Carbamazepine
- Penicillamine
- Cimetidine
- Phenytoin
- Ethosuximide
- Propylthiouracil
- Hydrazines
- Sulfasalazine
- Levodopa
- Sulfonamides
- Lithium
- Trimethadione

TREATMENT (cont.):

- GENERAL CONSIDERATIONS :
 - Prevention:
 - Avoid uv light and sun (sunsceening).
 - Antimalarial to prevent relapses.
 - Treat hypertension and dyslipidemias .
 - Treat depending on the organ system(s) involved:
 - Skin, musculoskeletal, and serositis.
 - NSAIDs,HCC,local cs.
 - More serious organ involvement(CNS,renal)
- Immunosuppression with high-dose steroids, AZA and/or
 - cyclophosphamide, mycophenolate, Tacrolimus
- Targeted therapy(biological) ,rituximab
 - Other treatments
 - plasma exchange for TTP or diffuse alveolar hemorrhage
 - and intravenous immunoglobulin for severe steroid-nonresponsive thrombocytopenia.

PROGNOSIS:

- Poor prognostic factors for survival in SLE include :
 - Renal disease (especially diffuse proliferative glomerulonephritis).
 - Hypertension
 - renal and central nervous system (CNS) disease
 - less education (?poor compliance)
 - Poor socioeconomic status (?inadequate access to medical care).
 - Black race (? low socioeconomic status)
 - Presence of antiphospholipid antibodies
 - High overall disease activity
 - Male sex
 - Men similar freq of renal, skin, arthritis, and CNS as women,
 - but less photosensitivity,
 - more serositis,
 - an older age at diagnosis,
 - and a higher one year mortality.
 - Young age
 - SLE in children more severe, higher malar rashes, nephritis, pericarditis, hepatosplenomegaly, and hematologic abnormalities.

Remission –

- After appropriate therapy,
 - many patients go into a clinical remission requiring no treatment.
 - a long-term follow-up of 667 patients noted:
 - ≈25 % had at least one treatment-free clinical remission lasting for at least one year.
 - The mean duration of remission was 4.6 years
 (?underestimate since one-half of the patients were still in remission at the end of follow-up).
 - A long history of SLE or the presence of renal or neuropsychiatric disease did not preclude remission

Antibodies Associated with Rheumatic Diseases: Percentages of Patients Affected		
Antibodies to	Percentages of patients	
Native DNA	SLE: 50% - 60%	
Sm antigen	SLE: 30%	
Histones	Drug-induced SLE: 95%	

SLE: ≤ 60%

Rheumatoid arthritis: 20% Sjogren's syndrome: 70% SS-A SLE: 30% - 40% Scleroderma and mixed connective tissue disease: frequency and titers low

SS-B Sjogren's syndrome: 60% **SLE: 15%**

Antibodies Associated with Rheumatic Diseases: (continued)

Antibodies to...

RNP	Mixed connective tissue disease: 95% - 100% SLE: 30% at low titers Scleroderma: 10% - 20%
