

Clinical Data

Amr Jamal, MD, SBFM, ABFM, MRCGP, GCMI, MBI
*Associate Professor and Consultant
Family Physician and Clinical Informatician
Head, Family and Community Medicine*
King Saud University, College of Medicine

Nasriah Zakaria
Assistant Professor
Medical Informatics & e-Learning Unit (MIELU)
King Saud University, College of Medicine

What are clinical data? [1]

- A datum is a single observation of a patient
- Clinical data are a collection of observations about a patient
- Each datum has five elements:
 - the patient (Amr Jamal)
 - the attribute (heart rate)
 - the value of the attribute (52 beats per minute)
 - the time of the observation (1:00 pm on 1/1/2015)
 - the method by which the attribute was obtained (heart monitor)

Types of clinical data [1]

- † **Narrative:** recording by clinician- maternity history
- † **Numerical measurements:** blood pressure, temperature
- † **Coded data:** selection from a controlled terminology system
example being the term MI that may mean myocardial infarction
or mitral insufficiency
- † **Textual data:** other results reported as text
- † **Recorded signals:** EKG, EEG
- † **Pictures:** radiographs, photographs, and other images

Use of clinical data [1]

- † Form basis of historical record
- † Support communication among providers
- † Anticipate future health problems
- † Record standard preventive measures
- † Identify deviations from expected trends example being a growth chart
- † Coding and billing
- † Provide a legal record
- † Support clinical research

Types of clinical data documents [1]

† History and physical examination:

- † by a clinician

† Progress notes

- † update of progress by primary, consulting, and ancillary providers

† Reports

- † by specialists, ancillary providers

† Typical paper chart maintains all patient notes in chronological order, sometimes separated into different components

Some complications of data [1]

†Circumstances of observation

e.g., how was heart rate taken? pulse? EKG?

†Uncertainty

how accurate is patient reporting, measurement, device?

†Time

what level of specificity do we need?

Some complications of data[2]

† Duplication

† e.g., multiple records in different departments

† Outdated

e.g. missing values

† Incorrectly formatted

does not follow standards

Structure of clinical data [1]

- † Medicine lacks uniform structured vocabulary and nomenclature as does Physics and Chemistry
- † Standardization and computerization of data is benefited by standard representations (Cimino, 2007)
- † Counter-arguments are “freedom of expression” and “art of medicine”
- † Narrative information when expressed in many ways can be ambiguous

Data entry [1]

- † General categories of data entry:
 - † **Free-form** entry by historical methods:
 - † writing
 - † dictation
 - † typing
 - † **Structured** (menu-driven) data entry by mouse or pen
 - † **Speech** recognition for either of above

ORCA CPOE order screen

The screenshot shows the ORCA CPOE order screen for a patient named 'zztest_cpoe'. The interface is divided into several key areas:

- Menu:** Located at the top left, it includes a 'Menu - Inpatient' dropdown and a list of navigation options such as 'Clinical Notes', 'Orders', 'Chart Summary', and 'MINDscape'.
- Refresh Button:** A button labeled 'Refresh Button' is located in the top right corner, next to a 'Print' button and a '5 minutes ago' timestamp.
- Status Bar:** A bar at the top right showing the patient's status as 'Meds History' and other relevant information.
- Med Recon:** A section for medication reconciliation, including buttons for 'Add', 'Document Medication by Hx', 'Reconciliation', and 'Check Interactions'.
- Orders Pane:** The main area for viewing and managing orders. It displays a table of orders with columns for 'Order Name', 'Status', and 'Details'. The table is categorized into sections like 'Code Status / Precautions', 'Diet / Nutrition', 'Medications', 'Lab / Path', 'Diagnostics Other', and 'Scheduling'.
- View Pane:** A sidebar on the left of the Orders Pane, showing a tree view of 'Orders for Signature' and 'Orders'. It includes categories like 'Communication', 'Admit / Tx / Disch', 'Code Status / Precautions', 'Vitals / Monitoring', 'Pt Care / Nursing', 'Respiratory', 'Activity', 'Diet / Nutrition', 'Infusions / TPN', 'Medications', 'Lab / Path', 'Radiology', 'Diagnostics Other', 'Consults / Therapies', 'DME / Supplies', 'Scheduling', 'Medication History', and 'Reconciliation History'.
- Clinical Categories:** A label pointing to the 'View Pane' sidebar, indicating the categories of clinical orders available.
- Initiate and Sign buttons:** A label pointing to the bottom right corner of the screen, where buttons for 'Initiate' and 'Sign' are located.

Structured or menu-driven data entry

† Can be done via mouse or pen, with typing

† Benefits

- † Data codified for easier retrieval and analysis
- † Reduces ambiguity if language used consistently

† Drawbacks

- † In general, more time-consuming
- † Requires exhaustive vocabulary
- † Requires dedication to use by clinicians

Speech recognition for data entry [1]

- † Most common use is for narration
 - † e.g., computer dictation of clinical notes
- † An advantage is instant availability of dictated content
- † Continuous speech recognition now is commercial reality
 - † Speaker-dependent systems require user training
 - † Speaker-independent are systems less accurate

Narratives tell a story.

† A narrative tells a story

- † See the patient through a description
- † Complicated events are easier to describe in text

† Undifferentiated problems

- † Interpretation.
 - † “only a human can prioritize and determine what the chief complaint really is”

MATERNAL HISTORY

Ann is a 28 year old G2 P1 (now) woman whose blood group is O positive. She was booked to deliver at Campbelltown Hospital under the care of Kaisher however delivered at Liverpool Hospital under the care of Dr Peter Hammill. She had a history of essential hypertension. This pregnancy was complicated by hypertension of pregnancy, fetal growth restriction, Bilateral Renal Pelvis dilatation 5 - 10mm, GBS +ve swab, fever, abnormal Dopplers, prolonged rupture of membranes for 2 days, clinically suspected chorioamnionitis. Ann was treated with antenatal steroids, tocolytics, and antihypertensive drugs. Following the spontaneous onset of labour, she proceeded to a vaginal delivery. Antibiotics were given before delivery.

PERINATAL HISTORY

Ian was born at 13:00 hours with a birth weight of 1070 grams (76th centile). Apgars were 3 at 1 minute and 7 at 5 minutes respectively treated with intubation and ventilation. The arterial cord pH was 7.24 and the base excess -6. Ian was then retrieved to

Relational DBMS [1]

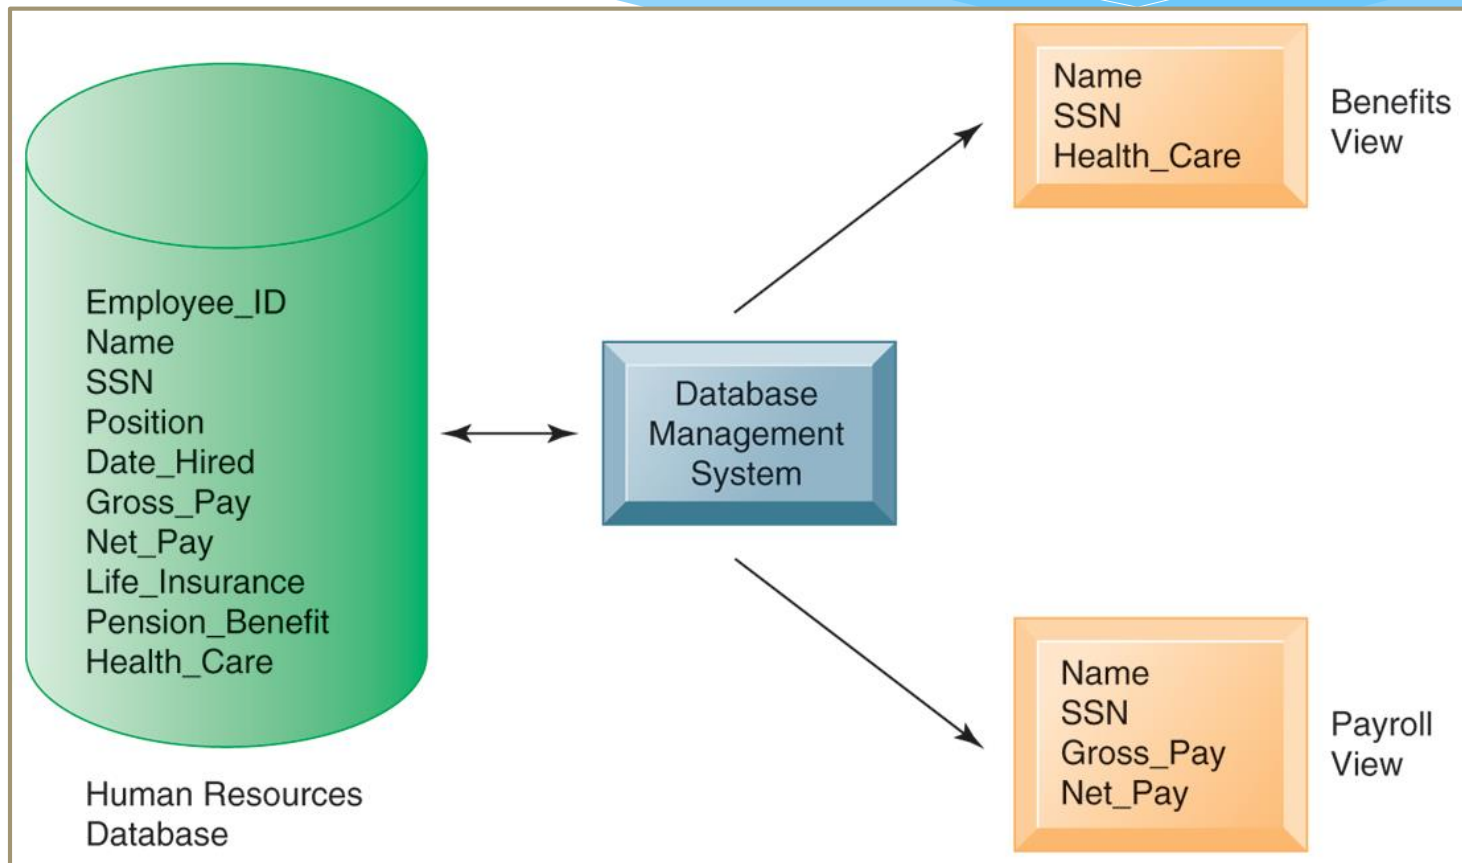

† Relational model links records to tables

† Allows efficiencies

- One-time information (e.g., demographics) stored only once
- Complex queries easier to construct and carry out

† Most query capabilities are based on **Structured Query Language (SQL)**-special language in relational database

Relational DBMS [2]

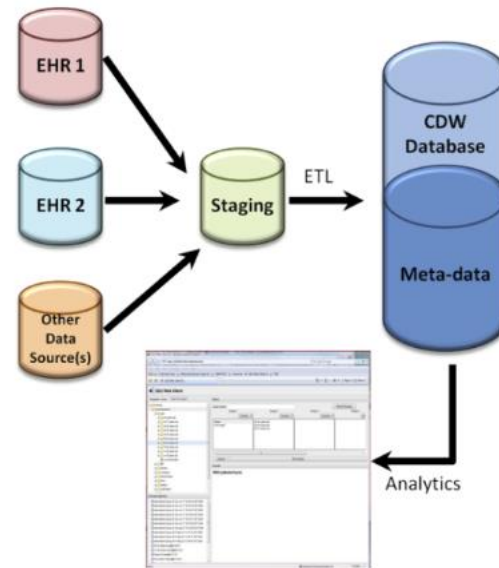

Clinical Data Warehouse [3]

- » Data from EHRs, Radiology, Pathology, etc. are copied into a staging database where they are cleaned and loaded into another common database and associated with meta data (data that describes data). ICD-type data is an example of meta data
- » Tools can be applied to the data in the CDW, such as simple descriptive analytics that reports the number of patients with breast cancer, their age, menopausal status, etc.
- » CDWs do a better job of analyzing and reporting aggregate healthcare data than the average EHR, which tends to focus on the individual

Clinical Data Warehouse[3]

- » CDWs can be used to evaluate a critical clinical process, cost estimates and they can analyze potential solutions
- » CDWs are highly valuable for informatics and evidence based medical research
- » CDWs can help track infections and report trends to public health

Clinical Data Warehouse[3]

ETL = extract,
transfer and load
