Statistical significance using *p*-value

Dr.Shaikh Shaffi Ahamed, PhD Professor Department of Family & Community Medicine College of Medicine, KSU

Learning Objectives

(1)Able to understand the concepts of statistical inference and statistical significance.

(2)Able to apply the concept of statistical significance(p-value) in analyzing the data.

(3)Able to interpret the concept of statistical significance(p-value) in making valid conclusions.

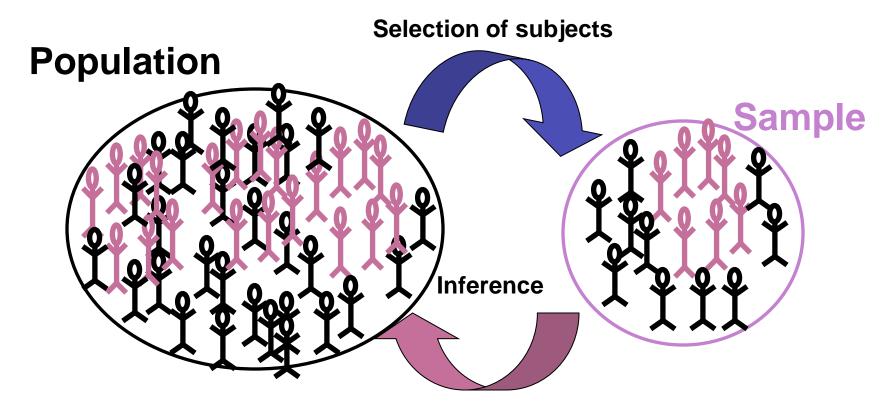

Why use inferential statistics at all?

Average height of <u>all</u> 25-year-old men (population) in KSA is a <u>PARAMETER.</u>

The height of the members of a sample of 100 such men are measured; the average of those 100 numbers is a **<u>STATISTIC</u>**.

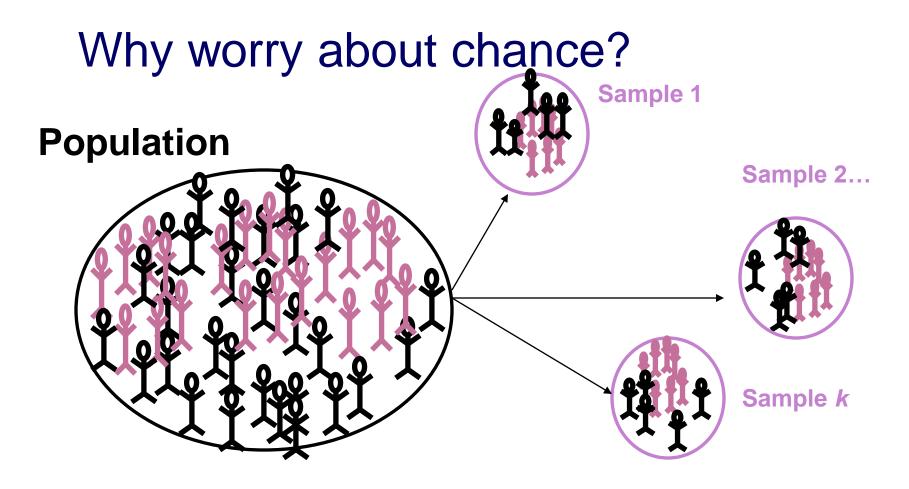

Using inferential statistics, we make inferences about population (taken to be unobservable) based on a random sample taken from the population of interest.

Is risk factor X associated with disease Y?

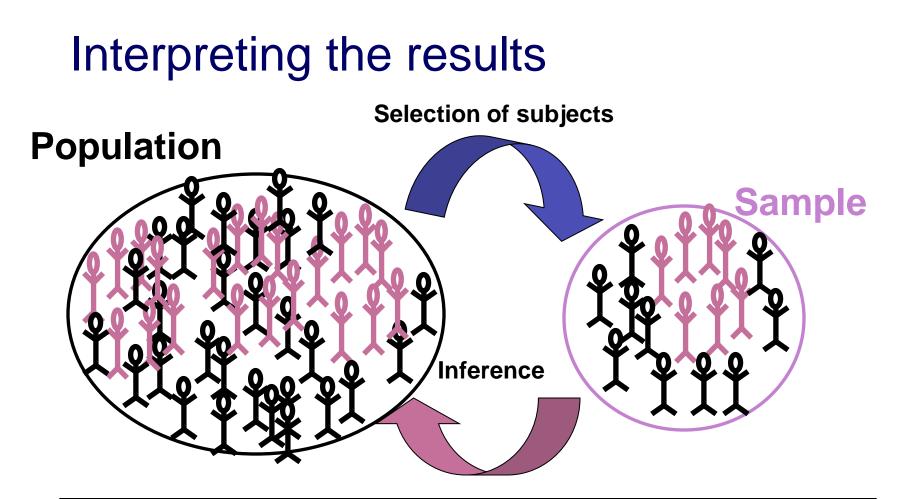

From the sample, we compute an estimate of the effect of X on Y (e.g., risk ratio if cohort study):

- Is the effect real? Did chance play a role?

Sampling variability...

- you only get to pick one sample!

Make inferences from data collected using laws of probability and statistics

- tests of significance (p-value)
- confidence intervals

Significance testing

 The interest is generally in comparing two groups (e.g., risk of outcome in the treatment and placebo group)

The statistical test depends on the type of data and the study design

Hypothesis Testing

- Null Hypothesis
- There is no association between the predictors(associated factors) and outcome variable in the population
- Assuming there is no association, statistical tests estimate the probability that the association is due to chance
- Alternate Hypothesis
- The proposition that there is an association between the predictors and outcome variable
- We do not test this directly but accept it by default if the statistical test rejects the null hypothesis

The Null and Alternative Hypothesis

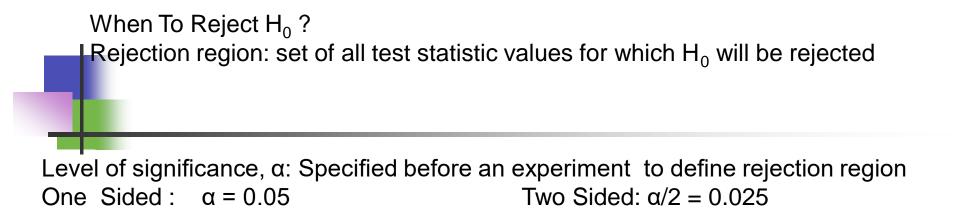

- States the assumption (numerical) to be tested
- Begin with the assumption that the null hypothesis is TRUE
- Always contains the '=' sign
 - The null hypothesis, H0

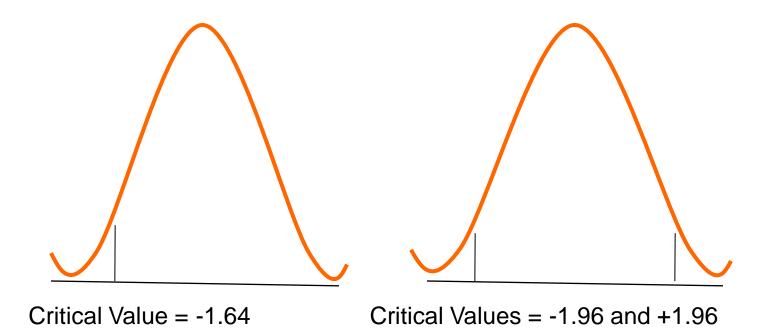

The alternative hypothesis, Ha

- Is the opposite of the null hypothesis
- Challenges the status quo
- Never contains just the '=' sign
- Is generally the hypothesis that is believed to be true by the researcher

One and Two Sided Tests

- Hypothesis tests can be one or two sided (tailed)
- One tailed tests are directional: H0: μ 1- μ 2= 0
- HA: μ1- μ2 > 0 or HA: μ1- μ2< 0
 - Two tailed tests are not directional: H0: μ 1- μ 2= 0 HA: μ 1- μ 2≠ 0

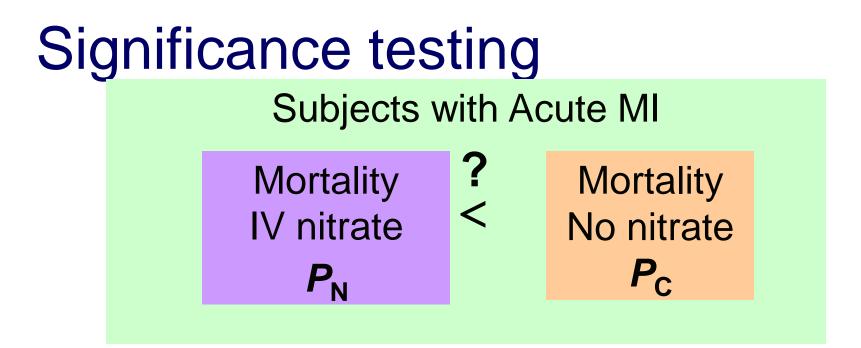

Type-I and Type-II Errors

- α = Probability of rejecting H₀ when H₀ is true
- * α is called significance level of the test
- β = Probability of not rejecting H₀ when H₀ is false
- * $1-\beta$ is called statistical power of the test

Diagnosis and statistical reasoning

	Disease status Present Absent		<u>Sig</u>	nificance Di Present	ifference is Absent		
				(Ho <i>not</i> true)	(Ho is true)		
Test +ve	r esult True +ve (sensitivity)	False +ve	<u>Test result</u> Reject Ho	<mark>No error</mark> 1-β	Type I err. α		
-ve	False –ve	True -ve (Specificity)	Accept Ho	Type II err. β	No error $1-\alpha$		
			α : significance level 1- β : power				

- Suppose we do a clinical trial to answer the above question
- Even if IV nitrate has no effect on mortality, due to sampling variation, it is very unlikely that $P_{\rm N} = P_{\rm C}$
- Any observed difference b/w groups may be due to treatment or a coincidence (or chance)

Null Hypothesis(H_o)

 There is no association between the independent and dependent/outcome variables

Formal basis for hypothesis testing

• In the example, H_o :"The administration of IV nitrate has no effect on mortality in MI patients" or $P_N - P_C = 0$

Obtaining P values

	Number dead / rar	ndomized				
Trial	Intravenous	Control	Risk Ratio	95% C.I. P value		
	nitrate		How do we get this <i>p</i> -value?			
Chiche	3/50	8/45	0.33	(0.09,1.13) 0.08		
Bussman	4/31	12/29	0.24	(0.08,0.74) 0.01		
Flaherty	11/56	11/48	0.83	(0.33,2.12) 0.70		
Jaffe	4/57	2/57	2.04	(0.39,10.71) 0.40		
Lis	5/64	10/76	0.56	(0.19,1.65) 0.29		
Jugdutt	24/154	44/156	0.48	(0.28, 0.82) 0.007		

Table adapted from Whitley and Ball. Critical Care; 6(3):222-225, 2002 17

Example of significance testing

In the Chiche trial:

• $p_{\rm N} = 3/50 = 0.06; p_{\rm C} = 8/45 = 0.178$

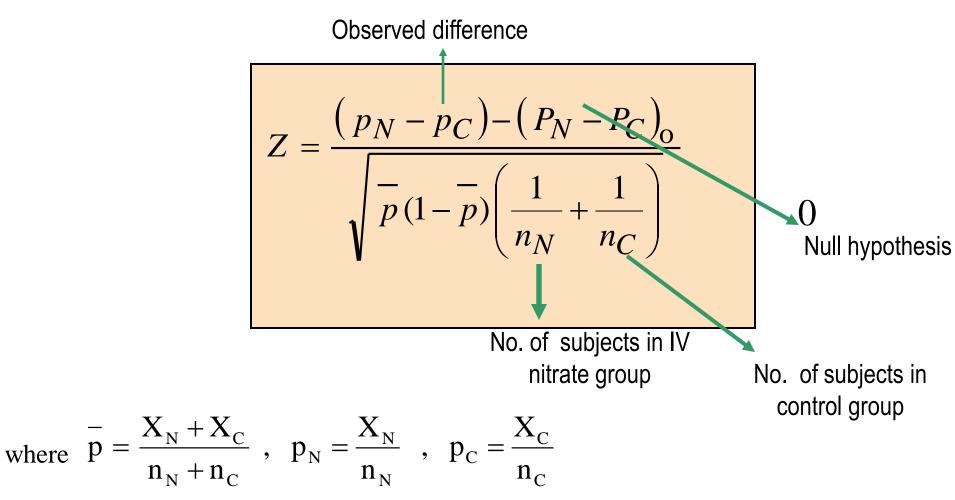

Null hypothesis:

• $H_0: p_N - p_C = 0 \text{ or } p_N = p_C$

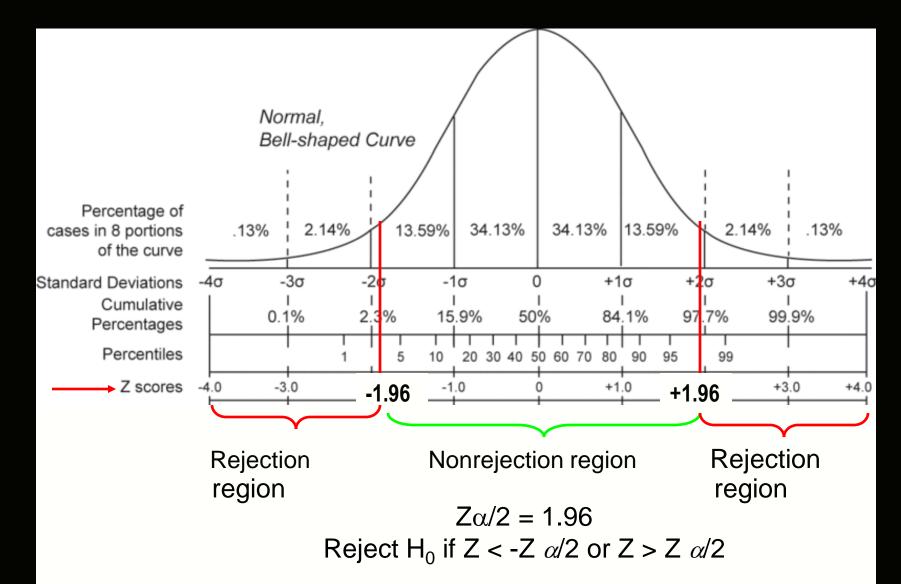

- Statistical test:
 - Two-sample proportion

Test statistic for Two Population Proportions

The test statistic for $p_1 - p_2$ is a Z statistic:

Testing significance at 0.05 level

Two Population Proportions

(continued)

$$Z = \frac{(0.06 - 0.178)}{\sqrt{0.116(1 - .116)\left(\frac{1}{50} + \frac{1}{45}\right)}} = -1.79$$

where

$$\overline{p} = \frac{3+8}{45+50} = 0.116$$
, $p_N = \frac{3}{45} = 0.06$, $p_C = \frac{8}{50} = 0.178$

Statistical test for $p_1 - p_2$

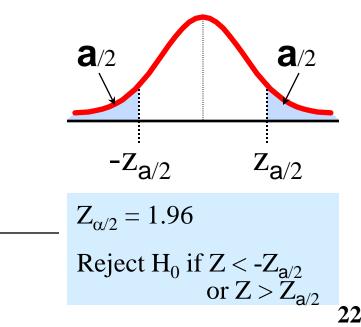

Two Population Proportions, Independent Samples

$$Z = \frac{\left(0.06 - 0.178\right)}{\sqrt{0.116(1 - .116)\left(\frac{1}{50} + \frac{1}{45}\right)}} = -1.79$$

Two-tail test:

$$H_0: p_N - p_C = 0$$

 $H_1: p_N - p_C \neq 0$

Since -1.79 is > than -1.96, we fail to reject the null hypothesis.

But what is the actual *p*-value?

P(Z < -1.79) + P(Z > 1.79) = ?

<u>p-value</u>

 After calculating a test statistic we convert this to a p-value by comparing its value to distribution of test statistic's under the null hypothesis

• Measure of how likely the test statistic value is under the null hypothesis p-value $\leq \alpha \Rightarrow$ Reject H₀ at level α p-value > $\alpha \Rightarrow$ Do not reject H₀ at level α

What is a *p*-value?

- 'p' stands for probability
 - Tail area probability based on the observed effect
 - Calculated as the probability of an effect as large as or larger than the observed effect (more extreme in the tails of the distribution), assuming null hypothesis is true
- Measures the strength of the evidence against the null hypothesis
 - Smaller p- values indicate stronger evidence against the null hypothesis

Stating the Conclusions of our Results

- When the *p*-value is small, we reject the null hypothesis or, equivalently, we accept the alternative hypothesis.
 - "Small" is defined as a *p*-value $\leq \alpha$, where $\alpha =$ acceptable false (+) rate (usually 0.05).
- When the p-value is not small, we conclude that we cannot reject the null hypothesis or, equivalently, there is not enough evidence to reject the null hypothesis.
 - "Not small" is defined as a *p*-value > α , where α = acceptable false (+) rate (usually 0.05).

STATISTICALLY SIGNIFICANT AND NOT STATISTICALLY SINGIFICANT

 <u>Statistically</u> <u>significant</u> Reject Ho

> Sample value not compatible with Ho

Sampling variation is an unlikely explanation of discrepancy between Ho and sample value <u>Not statistically</u> <u>significant</u>
 Do not reject Ho

Sample value compatible with Ho

Sampling variation is an likely explanation of discrepancy between Ho and sample value

	Number dead / rai	ndomized			
Trial	Intravenous nitrate	Control	Risk Ratio	95% C.I.	P value

Very weak evid finding	dence against th	e null hypo	thesisvery	y likely a char	nce
Lis	5/64	10/76	0.56	(0.19,1.65)	0.29
Jugdutt	24/154	44/156	0.48	(0.28, 0.82)	0.007
Very strong evi chance finding	dence against th	ne null hypo	othesisver	y unlikely to b	e a 29

Interpreting *P* values If the null hypothesis were true...

	Number dead / ran	ıdomized						
Trial	Intravenous nitrate	Control	Risk Ratio	95% C.I.	P value			
Chiche	3/50	8/45	0.33	(0.09,1.13)	0.08			
	8 out of 100 such trials would show a risk reduction of 67% or more extreme just by chance							
Flaherty	11/56	11/48	0.83	(0.33,2.12)	0.70			
	70 out of 100 such trials would show a risk reduction of 17% or more extreme just by chancevery likely a chance finding							
Lis	5/64	10/76	0.56	(0.19,1.65)	0.29			
Jugdutt	24/154	44/156	0.48	(0.28, 0.82)	0.007			
Very unlikely to be a chance finding 30								

Interpreting P values

Trial	Intravenous nitrate	Control	Risk ratio	95% confidence interval	P value
Chiche	3/50	8/45	0.33	(0.09, 1.13)	0.08
Bussman	4/31	12/29	0.24	(0.08, 0.74)	0.01
Flaherty	11/56	11/48	0.83	(0.33, 2.12)	0.7
Jaffe	4/57	2/57	2.04	(0.39, 10.71)	0.4
Lis	5/64	10/77	0.56	(0.19, 1.65)	0.29
Jugdutt	12/77	44/157	0.48	(0.28, 0.82)	0.007

Size of the p-value is related to the sample size

 Lis and Jugdutt trials are similar in effect (~ 50% reduction in risk)...but Jugdutt trial has a large sample size

Interpreting P values

	Trial	Intravenous nitrate	Control	Risk ratio	95% confidence interval	P value
	Chiche	3/50	8/45	0.33	(0.09, 1.13)	0.08
\langle	Bussman	4/31	12/29	0.24	(0.08, 0.74)	0.01
	Flaherty	11/56	11/48	0.83	(0.33, 2.12)	0.7
	Jaffe	4/57	2/57	2.04	(0.39, 10.71)	0.4
	Lis	5/64	10/77	0.56	(0.19, 1.65)	0.29
	Jugdutt	12/77	44/157	0.48	(0.28, 0.82)	0.007

 Size of the p-value is related to the effect size or the observed association or difference

 Chiche and Flaherty trials approximately same size, but observed difference greater in the Chiche trial

P values

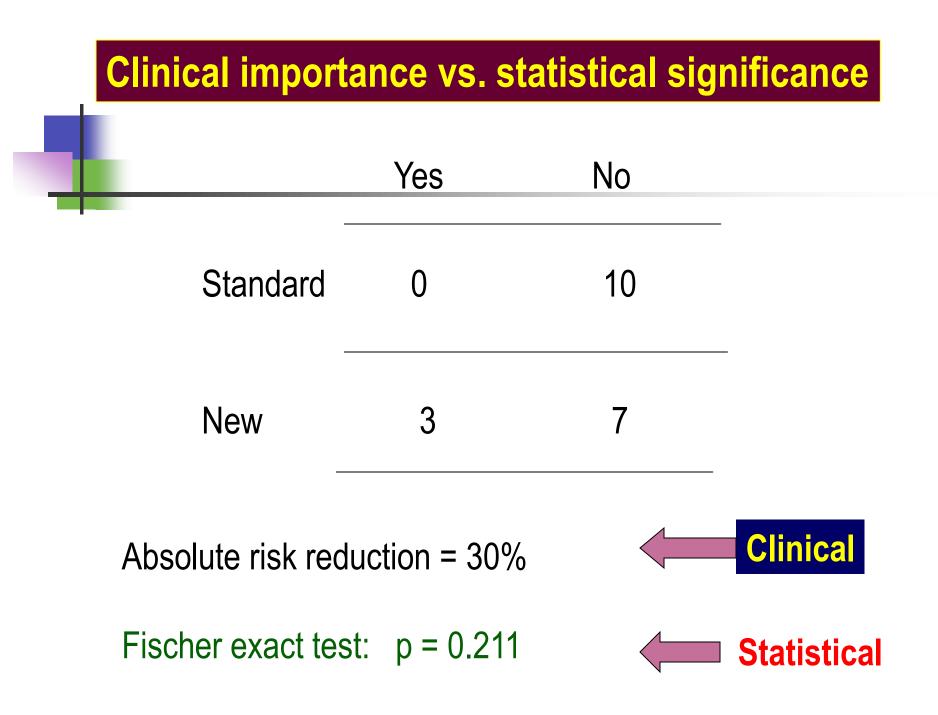

- P values give no indication about the clinical importance of the observed association
- A very large study may result in very small pvalue based on a small difference of effect that may not be important when translated into clinical practice
- Therefore, important to look at the effect size and confidence intervals...

Example: If a new antihypertensive therapy reduced the SBP by ImmHg as compared to standard therapy we are not interested in swapping to the new therapy.

- --- However, if the decrease was as large as 10 mmHg, then you would be interested in the new therapy.
- --- Thus, it is important to not only consider whether the difference is statistically significant by the possible magnitude of the difference should also be considered.

Clinical importance vs. statistical significance Cholesterol level, mg/dl 300 220 Standard, n= 5000 R Clinical Experimental, n=5000 218 300

p = 0.0023 Statistical

Reaction of investigator to results of a statistical significance test
