Mechanisms of Injury

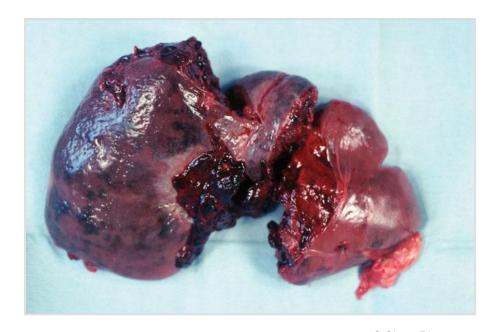

Ahmed Alburakan, MD, MSc ,FRCSC , FRCPC
Assistant professor & consultant
King Saud University

Introduction

- Trauma is the primary cause of death and disability between ages 1 to 44 years.
- Analyzing a trauma scene is a vital skill.
- Determining the events that lead to trauma, often predict the injuries encountered.

Trauma

 Injury occurs when an external source of energy affects the body beyond its ability to sustain and dissipate energy.

© Shout Pictures

Trauma

- Different forms of energy produce different kinds of trauma.
 - Mechanical energy
 - Chemical energy
 - Electrical energy
 - Barometric energy

Factors Affecting Types of Injury

- Ability of body to disperse energy delivered
- Force and energy
 - Size of object
 - Velocity
 - Acceleration or deceleration
 - Affected body area

- Duration and direction
 - The larger the area, the more energy will be dissipated.
- Position of victim

Factors Affecting Types of Injury

- The impact resistance of body parts has a bearing on types of tissue disruption.
 - Organs that have gas inside are easily compressed.
 - Liquid-containing organs are less compressible.

Blunt Trauma

Injuries in which tissues are not penetrated by external object

Motor Vehicle Crashes

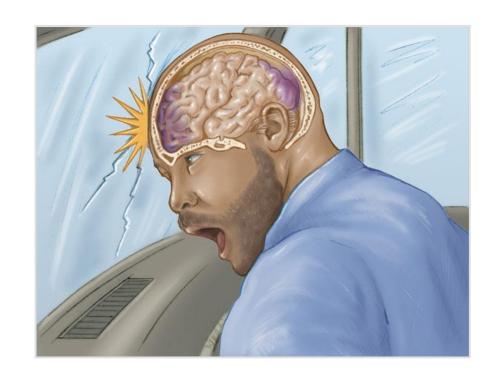

- Five phases of trauma:
 - Phase 1: Vehicle Deceleration
 - Phase 2: Occupant deceleration

Courtesy of Captain David Jackson, Saginaw Township Fire Department

Motor Vehicle Crashes

- Five phases of trauma (cont'd):
 - Phase 3: Deceleration of internal organs
 - Phase 4: Secondary collisions
 - Phase 5: Additional impacts received by the vehicle

Frontal or head-on impacts

- Front end of the car distorts.
- Passengers decelerate at same rate as vehicle.
- Abrupt deceleration injuries are produced by a sudden stop of a body's forward motion.

- Frontal or head-on impacts (cont'd)
 - Unrestrained occupants usually follow one of two trajectories:
 - Down-and-under pathway
 - Up-and-over pathway

- Lateral or side impacts
 - Impart energy to the near-side occupant
 - Seat belts offer little protection.
 - The body is pushed in one direction, while the head moves toward the impacting object.

© Alexander Gordeyev/ShutterStock, Inc.

- Rear impacts
 - Have the most survivors
 - Whiplash injury is common.
 - Energy is imparted to the front vehicle.

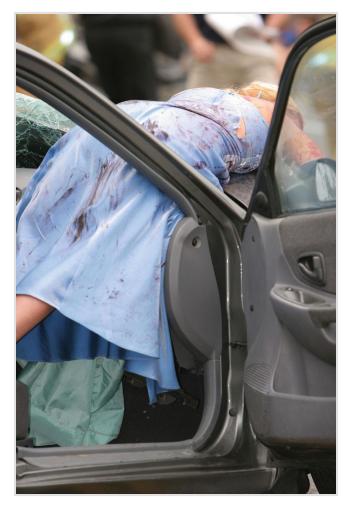

© Dennis Wetherhold, Jr

- Rotational or quarter-panel impacts
 - Occurs when a lateral crash is off center
 - The vehicle's forward motion stops, but the side continues in rotational motion.

Rollovers

- Patients may be ejected.
- Patients may be struck hard against the interior of the vehicle.

Restrained Versus Unrestrained Occupants

- Seat belts stop the motion of an occupant traveling at the same speed as the vehicle.
 - Associated injuries include cervical fractures and neck sprains.

Restrained Versus Unrestrained Occupants

- Air bags have reportedly reduced deaths in direct frontal crashes by about 30%.
 - Can also result in secondary injuries:
 - Direct contact
 - Chemicals

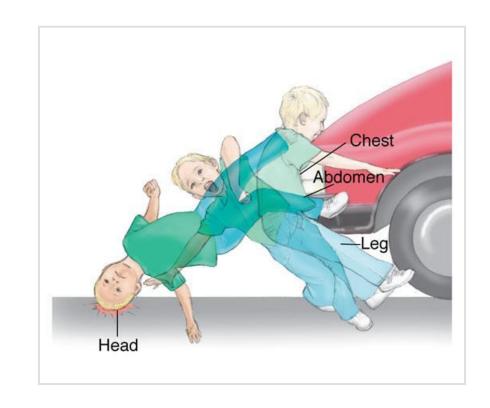

Pedestrian Injuries

- Three predominant MOIs:
 - First impact:
 - Car strikes body with its bumpers.
 - Second impact:
 - Adult is thrown on hood and/or grille of vehicle.
 - Third impact:
 - Body strikes the ground or some other object.

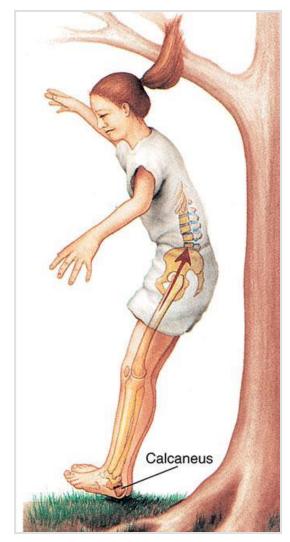

Pedestrian Injuries

- Waddell triad: Pattern of injuries in children and people of short stature
 - Bumper hits pelvis and femur.
 - Chest and abdomen hit grille.
 - Head strikes vehicle and ground.

Falls from Heights

- Severity of injuries impacted by:
 - Height
 - Position
 - Surface
 - Physical condition

Penetrating Trauma

- Involves disruption of skin and tissues in a focused area
 - Low velocity: Caused by sharp edges
 - Medium and high velocity: Object might flatten out, tumble, or ricochet.

Stab Wounds

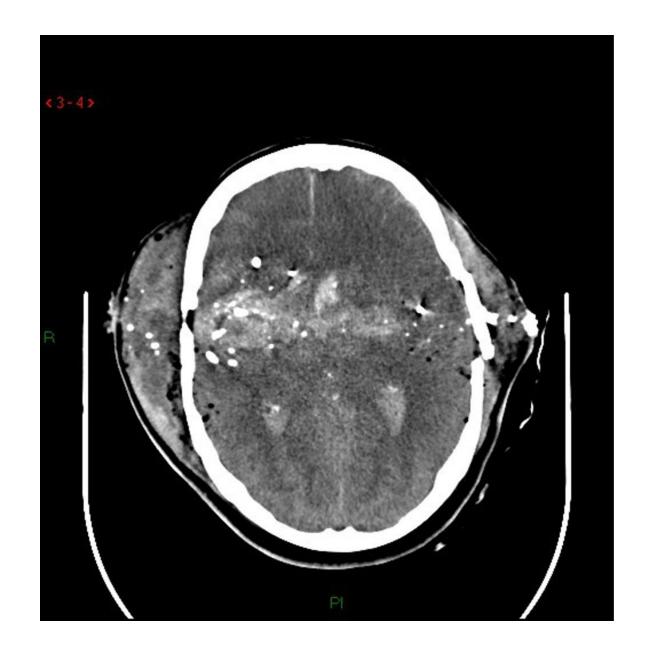

- Severity depends on:
 - Anatomic area involved
 - Depth of penetration
 - Blade length
 - Angle of penetration

- Severity depends on:
 - Type of firearm
 - Velocity of projectile
 - Physical design/size of projectile
 - Distance of victim from muzzle
 - Type of tissue struck

- Handgun
 - Revolver holds 6 to 10 rounds of ammunition
 - Pistol holds up to 17 rounds of ammunition
 - Accuracy is limited.

- Shotguns
 - Fire round pellets
- Rifles
 - Fire single projectile at a very high velocity
 - Impart a spin for accuracy

- Projectile creates a permanent cavity.
 - May be straight line or irregular pathway
 - Pathway expansion: Tissue displacement that results from low-displacement sonic pressure
 - Missile fragmentation:
 Projectile sends off fragments that create paths through tissues.

- Exit wounds occur when projectile's energy is not entirely dissipated.
 - Size depends on energy dissipated and degree of cavitation.

Entrance wound

D.Willoughby/Custom Medical Stock Photography

Exit wound

- Wounding potential depends on:
 - Powder charge
 - Size and number of pellets
 - Dispersion of the pellets
 - Range at which the weapon was fired
 - Barrel length
 - Type of choke at the end of the barrel

- Try to obtain the following:
 - Weapon used
 - Range fired
 - Bullet used

- Look for:
 - Powder residue around the wound
 - Entrance and exit wounds

Trauma Care

Goals/ Principles of Trauma Care

- Rapid, accurate, and physiologic assessment
- Resuscitate, stabilize, and monitor by priority
- Prepare for transfer to definitive care
- Teamwork for optimal, safe patient care

Principles

- Treat greatest threat to life first
- Definitive diagnosis less important
- Physiologic approach
- Time is of the essence
- Do no further harm
- Teamwork required to succeed

Approach

Airway with c-spine protection

Breathing/ ventilation/ oxygenation

Circulation: Stop the bleeding!

Disability (neuro status)

Expose/ Environment/ body temp

Sequence and Teamwork

Simultaneous primary survey and resuscitation of vital functions

 Simultaneous secondary survey and reevaluation of vital functions

In-hospital Preparation

- Preplanning essential
- Team approach
- Trained personnel
- Proper equipment

- Lab / x-ray capabilities
- Standard precautions
- Transfer agreements
- QI Program

Standard Precautions

- Cap
- Gown
- Gloves
- Mask
- Shoe covers
- Goggles/ face shield

Triage

- Sorting of patients according to
 - ABCDE's
 - Available resources
 - Other factors, e.g., salvageability

Primary Survey

Priorities are the same for all!

Primary Survey

- A Airway / C-spine protection
- Breathing / Life-threatening chest injury
- C Circulation / Stop the bleeding
- D Disability / Intracranial mass lesion
- E Exposure / Environment/ Body temp

Primary Survey: Airway

- Assess for airway patency
- Snoring
- Gurgling
- Stridor
- Rocking chest wall motions
- Maxillofacial trauma/ laryngeal injury

Resuscitation: Patent Airway

- Chin lift/ Modified jaw thrust
- Look, listen, feel
- Remove particulate matter
- Definitive airway as necessary
- Reassess frequently

Resuscitation: Assess Breathing

- Chest rise and symmetry
- Air entry
- Rate/ Effort
- Color/ Sensorium

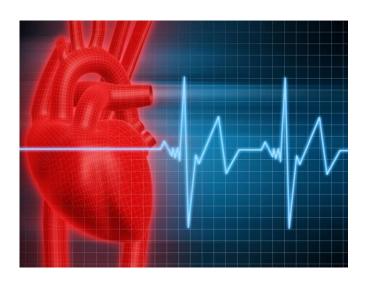

Tension / open pneumothorax

Resuscitation: Breathing

- Administer supplemental oxygen
- Ventilate as needed
- Tension pneumothorax: Needle decompression
- Open pneumothorax: Occlusive dressing
- Reassess frequently

Primary Survey: Circulation

- Non hemorrhagic shock
 - Cardiac tamponade
 - Tension pneumothorax
 - Neurogenic
 - Septic (late)

Primary Survey: Circulation

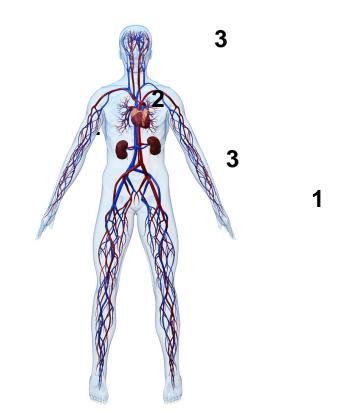

- Assess organ perfusion
 - Level of consciousness
 - Skin color
 - Pulse rate and character

Primary Survey: Circulation

Assess Organ Perfusion

- Tachycardia
- 2. Vasoconstriction
- 2. ↓ Cardiac output
- 2. Narrow pulse pressure
- 3. ↓ MAP
- 3. ↓ Blood flow

Resuscitation: Circulation

Bleeding?

Find it!

- Direct pressure
- Operation
- Avoid blind clamping

Resuscitation: Circulation

- Obtain venous access
- Restore circulating volume
 - Ringer's lactate, 1-2 L
 - PRBCs if transient response or no response
- Reassess frequently

Resuscitation: Circulation

Consider

- Tension pneumothorax: Needle decompression and tube thoracostomy
- Massive hemothorax: Volume resuscitation and tube thoracostomy
- Cardiac tamponade: Pericardiocentesis and direct operative repair

Primary Survey: Disability

- Baseline neurologic evaluation
 - Pupillary response
 - Neurosurgical consult as indicated

Primary Survey: Exposure

- Completely undress the patient
- Remove helmet if present
- Look for visible / palpable injuries
- Log roll, protect spine

Prevent hypothermia

Resuscitation: Overview

- If in doubt, establish definitive airway
- Oxygen for all trauma patients
- Chest tube may be definitive for chest injury
- Stop the bleeding!
- 2 large-caliber IVs
- Prevent hypothermia

Primary Survey: Adjuncts

Monitoring

- Vital signs
- ABGs
- ECG
- Pulse oximetry
- End-tidal CO₂

Diagnostic Tools

- Chest / pelvis x-ray
- C-spine x-rays when appropriate
- FAST
- DPL

Consider need for transfer

Secondary Survey: Start After

- Primary survey completed
- Resuscitation in process
- ABCDEs reassessed

Vital functions returning to normal

Secondary Survey: Key Parts

- AMPLE History
- Complete physical exam: Head-to-toe
- Complete neurologic exam
- Special diagnostic tests
- Reevaluation

Secondary Survey: History

- A Allergies
- M Medications
- Past illnesses / Pregnancy
- L Last meal
- E Events / Environment

Secondary Survey

Mechanism of Injury

Anatomy

Pattern of Injury

Mechanism of Injury

Summary

Definitive care

Safe transfer

Continuous Reevaluation

Primary Survey Adjuncts

Resuscitation

Secondary Survey Adjuncts

Summary

- One, safe way
- Do no further harm
- Treat greatest
 threat to life first
- Teamwork

Thank You
