Exercise 1: For each of the fractions shown below, indicate whether it is a:

- A. Ratio
- **B.** Proportion
- C. Rate
- D. None of the three.
- number of women in region A who died from stroke in 2010
 number of women in region A who died in 2010
- number of women in region A who died from stroke in 2010 estimated number of women living in region A on July 1, 2010
- number of women in region A who died from stroke in 2010 number of women in region A who died from cancer in 2010

Exercise 2: Among 13,963,753 males and 14,272,325 females, there were 20,734 cases of prostate cancer and 19,107 cases of female breast cancer. Calculate the incidence rates of prostate cancer and female breast cancer. Express your answers using an appropriate multiplier.

Prostate cancer	Female breast cancer		
Number of New cases Population at risk ¹ X 1000	Number of New cases Population at risk ¹ Number of New cases		
O X 1000 13,963,753	0 19,107 0 X 1000		
incidence rates of prostate cancer = 1.48 per 1000 Or = 148 per 100000	incidence rates of breast cancer = 1.34 per 1000 Or = 134 per 100000		

Exercise 3: In 2015, a total of 15,555 homicide deaths occurred among males and 4,753 homicide deaths occurred among females. The estimated 2001 midyear populations for males and females were 139,813,000 and 144,984,000 respectively.

from the information above calculate the following:

1 Homicide related death rates for males & females

MALES =
$$0 \frac{15,555}{139,813,000}$$
 $\times 100,000 = 11.1 \text{ homicide deaths per } 100000 \text{ Pop.}$

- 2 What type(s) of mortality rates did you calculate in Question 1?
 - Cause & Gender specific mortality rates
- 3 Ratio of homicide mortality rates for males compared to females

- "There are 3 homicide deaths among males for every female homicidal death."
- Interpret the rate you calculated in Question 3 as if you were presenting information to a policymaker
 - The calculations show that the mortality rates among males is higher than the females, So there should be specific interventions that target males and females differently.

Exercise 4: Using the data in Table 1, calculate the missing proportionate mortalities for persons aged 25-44 years for diseases of the heart and assaults (homicide).

	All ages			Ages 25-44 Years		
	Number	Percentage	Rank	Number	Percentage	Rank
All causes	2,443,930	100		128,924	100	
Diseases of heart	684,462	28	1	16,283		3
Malignant neoplasms	554,643	22.7	2	19,041	14.8	2
Cerebrovascular_disease	157,803	6.5	3	3,004	2.3	8
Chronic lower respiratory_diseases	126,128	5.2	4	401	0.3	* -
Accidents (unintentional injuries)	105,695	4.3	5	27,844	21.6	1
Diabetes mellitus	73,965	3	6	2,662	2.1	9
Influenza & pneumonia	64,847	2.6	7	1,337	1	10
Alzheimer's disease	63,343	2.6	8	0	0	*
Nephritis, nephrotic syndrome, nephrosis	33,615	1.4	9	305	0.2	* –
Septicemia	34,243	1.4	10	328	0.2	*
Intentional self-harm (suicide)	30,642	1.3	11	11,251	8.7	4
Chronic liver_disease and cirrhosis	27,201	1.1	12	3,288	2.6	7
Assault (homicide)	17,096	0.7	13	7,367		5
HIV_disease	13,544	0.5	* -	6,879	5.3	6
All_other	456,703	18.7	_	29,480	22.9	

Solution

Exercise 5: In 2009, 6 of 18 infected patients with H5N1 avian influenza died. What is the case fatality ratio (CFR)? What might cause this CFR to be overestimated?

1 Case fatality ratio (CFR)

Case Fatality Rate = Total number of death of Specific disease

Total number of Cases of Specific disease

Case Fatality Rate =

Case Fatality Rate =

Total number of death of Specific disease

X 100

X 200

Case Fatality Rate =

33%

Case Fatality Ratio =

1:3

2 What might cause this CFR to be overestimated?

- Because CFR is calculated from the KNOWN cases who presented to the hospital
- There might be A million cases that are asymptomatic! to avoid this we can do mass-screening to find out if there is a milder form of the same disease (as we saw with COVID-19)

Exercise 6: In a study concerned with the possible effects of air pollution on the development of chronic bronchitis, the following data were obtained. A population of 9,000 men aged 45 years was examined in January 2010. Of these, 6,000 lived in areas where they were exposed to air pollution and 3,000 did not. At this examination, 90 cases of chronic bronchitis were discovered, 60 among those exposed to air pollution. All the men initially examined who did not have chronic bronchitis were available for subsequent repeated examinations during the next 5 years. These examinations revealed 268 new cases of chronic bronchitis in the total group, with 30 among those unexposed to air pollution.

So, let's try to make it clear first.

All cases of chronic **All men = 9000 bronchitis** = 90

At risk (exposed) = Cases among 6000 exposed = 60

Not at risk (Not **Cases among not** exposed) = 3000exposed = 30

All men without chronic bronchitis after 5 years = 8910

Exposed men without chronic bronchitis after 5 years = 5940

Unexposed men without chronic bronchitis after 5 years = 2970

All cases after 5 **years** = 268

Cases among exposed group after **5 years = 238**

Cases among non-exposed group after 5 years = 30

1

- 0,05% A.
- В. 1%
- C. 2% X 100 = 1% (B)
- D. 3% 9000

2 chronic bronchitis for the 5 years among those exposed to air pollution:

- 39.7 A.
- В. 30.1
- 238 C. 10.0 $_{\circ}$ X 1000 = ~40.1% (E)
- D. 10.1 5940
- E. 40.1

2970

- A. 39.7
- В. 30.0
- C. 10.0
- D. 10.1
- E. 40.1

- A. 39.7

X 1000 = 10.1% (D)

- D.
- E. 40.1
- В. 30.1 268 $_{\circ}$ X 1000 = 30.1% (B) C. 10.0 8910
 - 10.1
