

# Heart Failure

Etiology And Diagnosis

---

Dr Hanan ALBackr

## ***Definition:***

---

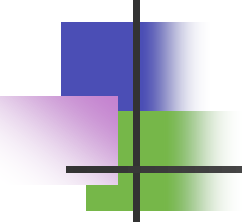

Heart failure (HF) is a **complex clinical syndrome** that can result from any **structural** or **functional** cardiac disorder that impairs the ability of the ventricle to **fill** with or **eject** blood.

# Prevalence

---

- Prevalence 0.4-2% overall, 3-5 % in over 65s, 10% of over 80s
- Commonest medical reason for admission
- Annual mortality of 60% over 80s
- > 10% also have AF
- Progressive condition - median survival 5 years after diagnosis

- 
- 
- REMEMBER LEFT VENTRICULAR FAILURE IS A TRUE LIFE THREATENING EMERGENCY

# ***Etiology***

---

- *It is a common end point for many diseases of cardiovascular system*
- It can be caused by :
  - Inappropriate work load (volume or pressure overload)
  - Restricted filling
  - Myocyte loss

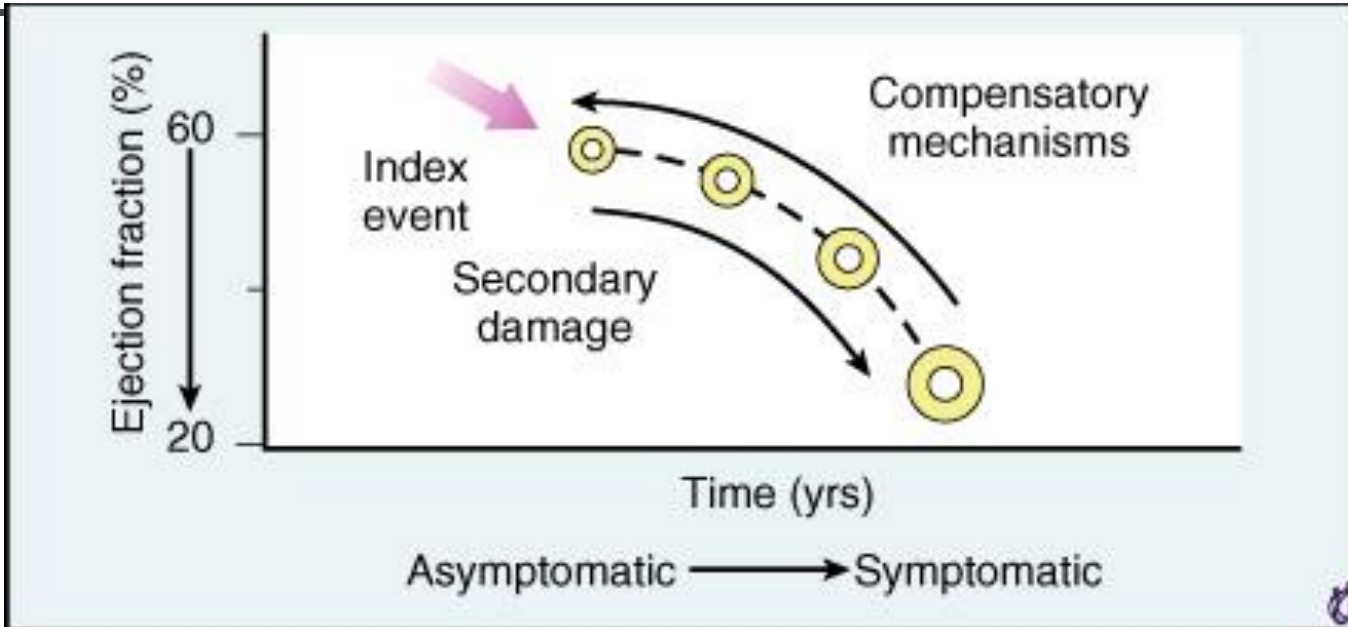

# ***Causes of left ventricular failure***

---

- ***Volume over load:*** Regurgitate valve  
High output status
- ***Pressure overload:*** Systemic hypertension  
Outflow obstruction
- ***Loss of muscles:*** Post MI, Chronic ischemia  
Connective tissue diseases  
Infection, Poisons  
(alcohol, cobalt, Doxorubicin)
- ***Restricted Filling:*** Pericardial diseases, Restrictive  
cardiomyopathy, tachyarrhythmia

# Background

- Heart failure pathophysiology
  - Index event
  - Compensatory mechanisms
  - Maladaptive mechanisms

# ***Pathophysiology***

---

- Hemodynamic changes
- Neurohormonal changes
- Cellular changes

# Hemodynamic changes

---

- *From hemodynamic stand point HF can be secondary to systolic dysfunction or diastolic dysfunction*

# Neurohormonal changes

<b>N/H changes</b>	<b>Favorable effect</b>	<b>Unfavor. effect</b>
<b>↑ Sympathetic activity</b>	↑ HR , ↑ contractility, vasoconst. → ↑ V return, ↑ filling	Arteriolar constriction → After load → ↑ workload → ↑ O <sub>2</sub> consumption
<b>↑ Renin-Angiotensin – Aldosterone</b>	Salt & water retention → ↑ VR	Vasoconstriction → ↑ after load
<b>↑ Vasopressin</b>	Same effect	Same effect
<b>↑ interleukins &amp; TNF<sub>α</sub></b>	May have roles in myocyte hypertrophy	Apoptosis
<b>↑ Endothelin</b>	Vasoconstriction → ↑ VR	↑ After load

# *Symptoms*

---

- **SOB, Orthopnea, paroxysmal nocturnal dyspnea**
- **Low cardiac output symptoms**
- **Abdominal symptoms:** *Anorexia, nausea, abdominal fullness, Rt hypochondrial pain*

# Physical Signs

- High diastolic BP & occasional decrease in systolic BP (decapitated BP)
- JVD
- Rales (*Inspiratory*)
- Displaced and sustained apical impulses
- Third heart sound – *low pitched sound that is heard during rapid filling of ventricle*

## ***Physical signs (cont.)***

---

- Mechanism of  $S_3$  sudden deceleration of blood as elastic limits of the ventricles are reached
- Vibration of the ventricular wall by blood filling
- Common in children

# ***Physical signs (cont.)***

---

- **Fourth heart Sound (S<sub>4</sub>)**

- Usually at the end of diastole
- Exact mechanism is not known  
Could be due to contraction of atrium against stiff ventricle

- **Pale, cold sweaty skin**

# ***Forms of Heart Failure***

---

- **Systolic & Diastolic**
- **High Output Failure**
  - Pregnancy, anemia, thyrotoxisis, A/V fistula, Beriberi, Pagets disease
- **Low Output Failure**
- **Acute**
  - large MI, aortic valve dysfunction---
- **Chronic**

# ***Forms of heart failure ( cont.)***

---

## ■ **Right vs Left sided heart failure:**

### **Right sided heart failure :**

*Most common cause is left sided failure*

Other causes included : Pulmonary embolisms

Other causes of pulmonary htn.

RV infarction

MS

Usually presents with: LL edema, ascites

hepatic congestion

cardiac cirrhosis (on the long run)

# ***Differential diagnosis***

---

- Pericardial diseases
- Liver diseases
- Nephrotic syndrome
- Protein losing enteropathy

# ***Laboratory Findings***

---

- Anemia
- Hyperthyroid
- Chronic renal insufficiency, electrolytes abnormality
- Pre-renal azotemia
- Hemochromatosis

# ***Electrocardiogram***

---

- Old MI or recent MI
- Arrhythmia
- Some forms of Cardiomyopathy are tachycardia related
- LBBB→*may help in management*

# ***Chest X-ray***

---

- Size and shape of heart
- Evidence of pulmonary venous congestion (dilated or upper lobe veins → perivascular edema)
- Pleural effusion

# ***Echocardiogram***

---

- Function of both ventricles
- Wall motion abnormality that may signify CAD
- Valvular abnormality
- Intra-cardiac shunts

# ***Cardiac Catheterization***

---

- When CAD or valvular is suspected
- If heart transplant is indicated

---

In conclusion, congestive heart failure is often assumed to be a disease when in fact it is a syndrome caused by multiple disorders.

# ***TREATMENT***

---

- Correction of reversible causes
  - Ischemia
  - Valvular heart disease
  - Thyrotoxicosis and other high output status
  - Shunts
  - Arrhythmia
    - A fib, flutter, PJRT
  - Medications
    - Ca channel blockers, some antiarrhythmics

# ***Diet and Activity***

---

- Salt restriction
- Fluid restriction
- Daily weight (tailor therapy)
- Gradual exertion programs

# ***Diuretic Therapy***

---

- The most effective symptomatic relief
- Mild symptoms
  - HCTZ
  - Chlorthalidone
  - Metolazone
  - Block Na reabsorption in loop of henle and distal convoluted tubules
  - Thiazides are ineffective with  $GFR < 30 \text{ ml/min}$

# ***Diuretics (cont.)***

---

## ■ **Side Effects**

- Pre-renal azotemia
- Skin rashes
- Neutropenia
- Thrombocytopenia
- Hyperglycemia
- ↑ Uric Acid
- Hepatic dysfunction

# Diuretics (cont.)

---

- **More severe heart failure → loop diuretics**

- **Lasix** (20 – 320 mg QD), Furosemide
- **Bumex** (Bumetanide 1-8mg)
- **Torseamide** (20-200mg)

**Mechanism of action:** Inhibit chloride reabsorption in ascending limb of loop of Henle results in natriuresis, kaliuresis and metabolic alkalosis

**Adverse reaction:**

pre-renal azotemia  
Hypokalemia  
Skin rash  
ototoxicity

# ***K<sup>+</sup> Sparing Agents***

---

- **Triamterene & amiloride** – acts on distal tubules to ↓ K secretion
- **Spironolactone** (Aldosterone inhibitor)

*recent evidence suggests that it may improve survival in CHF patients due to the effect on renin-angiotensin-aldosterone system with subsequent effect on myocardial remodeling and fibrosis*

# ***Inhibitors of renin-angiotensin-aldosterone system***

---

- Renin-angiotensin-aldosterone system *is activation early in the course of heart failure and plays an important role in the progression of the syndrome*
- Angiotensin converting enzyme inhibitors
- Angiotensin receptors blockers
- Spironolactone

# ***Angiotensin Converting Enzyme Inhibitors***

---

- *They block the R-A-A system by inhibiting the conversion of angiotensin I to angiotensin II → vasodilation and ↓ Na retention*
- *↓ Bradykinin degradation ↑ its level → ↑ PG secretion & nitric oxide*
- Ace Inhibitors were found to improve survival in CHF patients
  - Delay onset & progression of HF in pts with asymptomatic LV dysfunction
  - ↓ cardiac remodeling

# ***Side effects of ACE inhibitors***

---

- Angioedema
- Hypotension
- Renal insufficiency
- Rash
- cough

# ***Angiotensin II receptor blockers***

---

- Has comparable effect to ACE I
- Can be used in certain conditions when ACE I are contraindicated (angioneurotic edema, cough)

# ***Digitalis Glycosides*** ***(Digoxin, Digitoxin)***

---

- The role of digitalis has declined somewhat because of safety concern
- Recent studies have shown that digitalis does not affect mortality in CHF patients but causes significant
  - Reduction in hospitalization
  - Reduction in symptoms of HF

# ***Digitalis (cont.)***

## **Mechanism of Action**

---

- +ve inotropic effect by  $\uparrow$  intracellular Ca & enhancing actin-myosin cross bridge formation (binds to the Na-K ATPase  $\rightarrow$  inhibits Na pump  $\rightarrow$   $\uparrow$  intracellular Na  $\rightarrow$   $\uparrow$  Na-Ca exchange)
- Vagotonic effect
- Arrhythmogenic effect

# ***Digitalis Toxicity***

---

- Narrow therapeutic to toxic ratio
- Non cardiac manifestations
  - Anorexia,
  - Nausea, vomiting,
  - Headache,
  - Xanthopsia scotoma,
  - Disorientation

# ***Digitalis Toxicity***

---

## ■ **Cardiac manifestations**

- Sinus bradycardia and arrest
- A/V block (usually 2<sup>nd</sup> degree)
- Atrial tachycardia with A/V Block
- Development of junctional rhythm in patients with a fib
- PVC' s, VT/ V fib (bi-directional VT)

# ***$\beta$ Blockers***

---

- Has been traditionally contraindicated in pts with CHF
- Now they are the main stay in treatment on CHF & may be the only medication that shows substantial improvement in LV function
- In addition to improved LV function multiple studies show improved survival
- The only contraindication is severe decompensated CHF

# ***Antiarrhythmics***

---

- Most common cause of SCD in these patients is ventricular tachyarrhythmia
- Patients with h/o sustained VT or SCD → ICD implant

# ***New Methods***

---

- **Implantable ventricular assist devices**
- **Biventricular pacing** (only in patient with LBBB & CHF)
- **Artificial Heart**

# ***Cardiac Transplant***

---

- It has become more widely used since the advances in immunosuppressive treatment
- Survival rate
  - 1 year 80% - 90%
  - 5 years 70%

# *Prognosis*

---

- Annual mortality rate depends on patients symptoms and LV function
- 5% in patients with mild symptoms and mild ↓ in LV function
- 30% to 50% in patient with advances LV dysfunction and severe symptoms
- 40% – 50% of death is due to SCD
